Deaf-mutes communicate their thoughts by means either of significant or arbitrary signs or motions, or of a manual alphabet formed by positions of the fingers of one or both hands. The accompanying illustration shows a form of the single-hand alphabet now universally taught to deaf-mutes in the United States. The two-hand alphabet, invented about the close of the eighteenth century, is somewhat more complicated, and is in limited use in other countries. Deaf-mutes are taught in many cases to understand spoken language by observing the motions of the speaker's lips, and to use articulate speech themselves, sometimes very distinctly.

Incapacity of perceiving or distinguishing sounds, in consequence of the impairment of the organs of hearing; that state of the organs which prevents the reception of the impressions that constitute hearing; want of the sense of hearing. Deafness occurs in every degree, from that which merely impairs the accuracy of the ear in distinguishing faint or similar sounds, to that state in which there is no more sensation produced by sounds in this organ than in any other part of the body. Dumbness is the usual concomitant of complete deafness, but in general results rather from the absence of incitement by the sense of hearing than from any natural defect in the organs of speech. See *deaf-mute*.

The AS. word has suffered a similar restriction of meaning, being now E. *thill*, the shaft or pole of a cart, etc. Thus *deal*² is a doublet of *thill*: see *thill*. The word *deal*² is usually identified with *deal*¹, a part, with the accommodated definition "the division of a piece of timber made by sawing." 1. A board or plank. The name *deal* is applied chiefly to planks of pine or fir above 7 inches in width and of various lengths exceeding 6 feet. If 7 inches or less wide, they are called *battens*; and when under 6 feet long they are called *deal-ends*. The usual thickness is 3 inches, and width 9 inches. The standard size, to which other sizes may be reduced, is 2½ inches thick, 11 inches broad, and 12 feet long. A whole *deal* is a deal which is 14 inches thick; a *split deal*, one of half that thickness. The word is little used in the United States.

An ecclesiastical title in the Roman Catholic and Anglican churches, which has had several applications. Civil officials so called were known to the Roman law, and are mentioned in the codes of Theodosius and Justinian. The title was thence adopted for Christian use. In the monasteries, for every ten monks a decanus or dean was nominated, who had the charge of their discipline. The senior dean, in the absence of the abbot and provost, governed the monastery; and, since monks had the charge of many cathedral churches, the office of dean was thus introduced into them. Custom gradually determined that there should be only one dean in a cathedral, and he eventually assumed the chief charge of its ecclesiastical and ritual concerns, especially in regard to the choir. He became also general assistant to the bishop. In the Roman Catholic Church, assistants of the bishop, termed *rural deans*, in France in former times often possessed, and in Germany in certain cases still possess, large powers of visitation, administration, and jurisdiction, so that their authority is almost equal to that of bishops. In the Church of England there are, besides the deans of the cathedrals, called *deans of chapters*, whose authority is next that of the bishop, *rural deans*, who are in effect assistants to the bishop, and whose duty it is to visit certain parishes in the diocese, and report on their condition to the bishop. Their functions at one time became almost obsolete, but they have been revived to some extent in recent times. The word is also applied in England to the chief officers of certain peculiar churches or chapels: as, the dean of the king's chapel. In the Episcopal Church in America the presiding presbyter of the semi-official body known as a convocation, and of the division of a diocese represented by this body, which division is also called a convocation and is in some respects analogous to the English rural deanery, is called a dean (the dean of convocation).

To save a bishop, may I name a dean? *Pope, Epil. to Satires, II. 33.*

2. In universities, originally, the head of a faculty (and most historical writers consider a

dean as essential to the existence of a faculty). The office was at first directly or indirectly elective for one or two years, while commonly filled by the eldest master regent. But the faculties, having in Great Britain and America lost their early more independent corporate existence, are now usually presided over by the head of the university, and the office of dean has sunk to that of a mere registrar or secretary, or has ceased to exist. In English colleges the dean presides in chapel, looks after the moral and religious welfare of the scholars, and is charged with the preservation of discipline. The office is commonly united with one of the tutorships. The office of dean of a college or school is evidently a mere adaptation of that of dean of a monastery, and as such dates from far earlier times than that of dean of a faculty, although the faculties long preceded the colleges.

Certain censors, or *deanes*, appointed to look to the behaviour and manner of the Studenta there [at Cambridge]. *Holinshed, Chronicles.*

3. The president for the time being of an incorporation of barristers or law practitioners.—**Dean and chapter**, a bishop's council, consisting of the dean and his prebendaries, whose duties consist in aiding the bishop with their advice in affairs of religion and in the temporal concerns of his see.—**Dean of Arches**, the chief judicial officer of the Archbishop of Canterbury, dean of the Court of Arches, but not really a dean in the modern sense of the word.—**Dean of Faculty**, the president of the Faculty of Advocates in Scotland.—**Dean of gild**. (a) The chief officer of a medieval trade-gild, and of some existing gilds in Europe.

The number ten; in a Pythagorean or cabalistic sense, as an element of the universe, the tetractys or quaternary number. In this sense the form *decad* is exclusively used. The *decad* was considered significant as being the base of numeration and potentially embracing all numbers, and thus representing the cosmos or its source. It was further considered as highly significant that the *decad* is 1 + 2 + 3 + 4, for four naturally suggests organic perfection, since melodies and other compositions are best divided into four parts, and for other reasons; so that the greatness of Pythagoras as a philosopher was summed up in his title of "revealer of the quaternary number." By cabalists it is considered important as being the number of the commandments.

All numbers and all powers of numbers appeared to them [the Pythagoreans] to be comprehended in the *decad*, which is therefore called by Philolaus great, all-powerful, and all-productive, the beginning and the guide of the divine and heavenly, as of the terrestrial life.

In the *Deciduata* . . . the superficial layer of the mucous membrane of the uterus undergoes a special modification, and unites . . . with the villi developed from the chorion of the fetus; . . . and, at birth, this decidua and maternal part of the placenta is thrown off along with the fetus, the mucous membrane of the uterus . . . being regenerated during, and after, each pregnancy.

Huxley, Anat. Vert., p. 282.

deciduate (dē-sīd'ū-āt), *a.* [*< NL. deciduatus*, having a decidua, *< decidua*, a decidua: see *decidua*.] 1. Having a decidua or a deciduous placenta; pertaining to or having the characters of the *Deciduata*.—2. Being deciduous, as a placenta.

deciduity (des-i-dū'i-ti), *n.* [*< deciduous + -ity*.] Deciduousness. [*Rare.*]

deciduous (dē-sīd'ū-us), *a.* [= *F. décidu* = *Sp. deciduo*, *< L. deciduus*, that falls down, *< decidere*, fall down, *< de*, down, + *cadere*, fall: see *decay*.] Falling or liable to fall, especially after a definite period of time; not perennial or permanent.

There is much that is *deciduous* in books, but all that gives them a title to rank as literature in the highest sense is perennial.

Lovell, Among my Books, 1st ser., p. 177.

Deciduous institutions imply *deciduous* sentiments.

H. Spencer, Social Statics, p. 458.

Specifically—(a) *In bot.*: (1) Falling off at maturity or at the end of the season, as petals, leaves, fruit, etc.: in distinction from *fugacious* or *caducous* organs, which fall soon after their appearance, and from *persistent* or *permanent*, as applied to leaves, from *evergreen*. (2) Losing the foliage every year: as, *deciduous* trees. (b) *In zool.*: (1) Falling off at a certain stage of an animal's existence, as the hair, horns, and teeth of certain animals. (2) Losing certain parts regularly and periodically, or at certain stages or ages: as, a *deciduous* insect.—**Deciduous cusps** or **pieces of the mandibles**, in *entom.*, appendages, one on the outer side or end of each mandible, which are generally lost soon after the insect attains the imago state, leaving scars. They are found in a single family of rhynchophorous *Coleoptera*, the *Otiorynchidae*.—**Deciduous dentition**. See *dentition*.—**Deciduous insects**, those insects that cast off the wings after copulation, as the females of ants and termites.—**Deciduous membrane**. See *decidua*.

According to the modern French notation, which is also used in the United States, a thousand involved to the eleventh power, being a unit with thirty-three ciphers annexed. [Owing to the ambiguity resulting from the partial adoption of the second meaning, this and similar words (except *million*) are practically disused.]

Heylin, Hist. Presbyterians, p. 469.

Decimal arithmetic, the ordinary method of arithmetical calculation by the Arabic notation. The term is sometimes restricted to the calculation with decimals.—**Decimal currency**. See *currency*.—**Decimal fraction**, a fraction whose denominator is a power of 10. So long as the quantity is conceived as having a power of 10 for its denominator it is properly and usually called a decimal fraction, however it may be written. The ordinary method of writing it is by prefixing to the numerator (used alone) a dot (the decimal point) with a number of zeros sufficient to make the number of places in the numerator equal to that in the denominator, less one. Thus, $\frac{1}{10} = .1$, $\frac{1}{100} = .01$, $\frac{1}{1000} = .001$, etc.; $2\frac{1}{10} = 2.06$, etc. See *II.*—**Decimal measure**, any measure belonging to a decimal system.—**Decimal notation**, a system of writing numbers depending on powers of 10, especially the ordinary system by means of nine digits and a cipher. The system in an imperfect form, wanting the 0 (the places being preserved by ruled columns), is believed to have been invented in India, and is explained in the Latin geometry of Boëthius (died about A. D. 525). The genuineness both of the passage and of the entire work has been much disputed, but is now more usually conceded. The system was, however, entirely disused in Europe until having been completed by the invention of the 0) it was reintroduced through the Arabians (by whom it is called the *Indian notation*), being first systematically explained in the work of Leonardo da Pisa, about 1200. The extension of the system to fractions was accomplished much later. See *II.*—**Decimal numeration**, any system of naming numbers by taking them in multiples and powers of 10. Such systems have generally prevailed in all languages, being founded on the use of the ten fingers as helps to count.—**Decimal place**, the position of a figure in decimal notation.—**Decimal point**, a dot separating the whole part from the fractional part of an expression in decimal notation. The decimal point appears to have been first used by Napier (*Constructio*, 1619); the writing of it above the line by Newton. See *II.*—**Decimal system**, any system of measurement or of counting whose units are powers of 10; especially, the metric system (which see, under *metric*).

2. *n.* An expression denoting a decimal fraction by an extension of the decimal notation. A dot, called the *decimal point*, being placed to the right of the units' place, figures are written to the right of it, the first place in passing to the right being appropriated to tenths, the second to hundredths, etc. Thus, 199320.3 is the same as 199320 $\frac{3}{10}$; 19932.03 is the same as 19932 $\frac{3}{100}$; and 1.993203 is the same as 1 $\frac{993203}{1000000}$. (See *Decimal fraction*, above.) The invention of decimals is usually attributed to Stevinus (1582). In his notation a mixed number, for example 1993 $\frac{3}{10}$, which is now written 1993.3, would have been written 1993(0)2(10)29(3). The decimal point may be placed above the line (a common practice) or on the line.—**Recurring decimal**, a decimal in which after a certain point the digits are continually repeated. If there is but one recurring figure, the expression is called a *repeating decimal*; if there are more than one, the ex-

pression is called a *circulating decimal*. But these distinctions are not commonly observed with strictness. A circulating decimal is denoted by means of dots over the first and last figures of the recurring period. Thus, $\frac{1}{3}$ is 0.0135, that is, 0.0135135135, etc.

decimalism (des'i-mal-izm), *n.* [*< decimal + -ism*.] The theory or system of a decimal notation or division, as of numbers, currency, weights, etc.

2. To select by lot and put to death every tenth man of: as, to *decimate* a captured army or a body of prisoners or mutineers (a barbarity occasionally practised in antiquity).

Determination is the settling upon some line of action with a fixed purpose to stick to it; it is somewhat nearer than the others to doggedness, and sometimes approaches obstinacy. Determination may be negative, as not to do a thing, but resolution is generally positive or active; it often implies more courage than the others, and is otherwise more high-minded. But these words are often used interchangeably.

2. An approximately horizontal platform or floor extending from side to side of a ship or of a part of a ship, as of a deck-house, and supported by beams and carlines. In wooden ships the deck is formed of planks about three inches wide and three inches thick, spiked to the beams and carlines; in iron ships it is formed of iron plating riveted to the beams and girders and generally covered with wooden planking. An armored deck is protected by iron or steel plating. The spar-deck is the upper deck of those which extend from stem to stern; the main deck is the deck immediately below the spar-deck in a double-decked ship; the quarter-deck is that part of the spar-deck which is abaft the mainmast; the topgallant forecastle-deck is a short deck above the spar-deck in the forward part of the ship, generally extending as far aft as the foremast. In a man-of-war the berth-deck is the deck below the gun-deck, where the mess-lockers and tables are placed, and where the hammocks are slung. The gun-deck is the deck of a man-of-war where the battery is carried; in old line-of-battle ships, where guns were carried on three decks below the spar-deck, they were called respectively the upper, middle, and lower gun-deck. A flush deck is a spar-deck clear from stem to stern of houses or other encumbrances. The term half-deck was formerly applied to the after part of the deck next below the spar-deck, and forward of the cabin bulkhead. The hurricane-deck is the upper light deck of side-wheel passenger-steamers. The orlop-deck is below the berth-deck, and is where the cables were formerly stowed. The poop-deck is the after part of the ship, over the cabin, when the cabin is on the spar-deck. States the *boiler-deck* is the deck on which the boilers are carried. A *cambered deck* is a deck arched so as to be higher in the middle than at the stem or stern—the opposite of the usual practice.

We need a word to express the act in question; we have none but the participle "declining." . . . "Declinaire" may yet make its way into reputable use. *Pelphs*, *Eng. Style*, p. 362.

It is distinguished from the earlier Pointed style, from which it was developed, by the more flowing lines of its tracery, especially of its windows, by the more intricate and less conventional combinations of its foliage, by the greater elaboration of its capitals, moldings, finials, etc., and generally by a style of ornamentation more naturalistic and as a rule less in accordance with true artistic principles. The *Decorated style* has been divided into two periods: namely, the *Early* or *Geometric Decorated* period, in which the ornament consists especially of simple curves and lines and combinations of them; and the *Decorated style* proper, in which the peculiar characteristics of the style are most emphasized, and meager or involved arrangement of lines in ornament takes the place of the broad treatment of masses which characterizes earlier medieval work.

decrease (dē-krēs'), *v.*; pret. and pp. *decreased*, ppr. *decreasing*. [*< ME. decrescen*, < *OF. decresser*, *decrestre*, *decreistre*, *decreen*, < *OF. decroistre* = *Sp. decrecer* = *Pg. decrescer* = *It. decrescere* (cf., with altered prefix, *ME. decresen*, < *OF. decresistre*, *descroistre* = *Pr. decresser* = *Sp. decrescer* = *It. decrescere*, < *ML. discrescere*), < *L. decrescere*, decrease, become less, wane, < *de*, from, away, + *crecere*, grow: see *crecent*. He must increase, but I must *decrease*. *John* iii. 30.

Decreasing series. See *progression*. = *Syn.* *Decrease*, *Diminish*, *Dwindle*, *Contract*; to lessen, abate, ebb, subside, fall off, fall away, shrink. The first three all mean a becoming less by degrees. *Decrease* more often implies that the cause are imperceptible or not necessarily perceptible, acting, it may be, from within the object itself: as, the swelling *decreases* daily. *Diminish* generally implies the action of some external cause which is more or less in the mind of those concerned: as, his fortune *diminishes* daily through extravagance; the troops *diminish* steadily under disease and conflict. *Decrease* is the appropriate word for reduction of bulk or volume, *diminish* for reduction of number. These distinctions are not always observed. To *dwindle* is to become small in size, amount, or number by slow and imperceptible degrees, the reduction being always undesirable and the result a sort of attenuation; as, the army *dwindled* to a few thousands; the child *dwindled* to a mere skeleton. To *contract* is to become less by shrinkage or a drawing together of parts or elements; it implies loss of size, bulk, or extent, without the loss of constituent substance or parts usually expressed by the other words.

So many wives, who have yet their husbands in their arms; so many parents, who have not the number of their children lessened; so many villages, towns, and cities, whose inhabitants are not *decreased*, their property violated, or their wealth *diminished*, are yet owing to the sober conduct and happy results of your advice.

Sw. dekret*, < *L. decretum*, a decree, ordinance, decision, neut. of *decretus*, pp. of *decernere*, decree, decide (> *E. decern*): see *decern*.] 1. A special ordinance or regulation promulgated by civil or other authority; an authoritative decision having the force of law.

The bounds of freedom wider yet
By shaping some august *decree*.

Tennyson, To the Queen.

On December 7, 1866, the Emperor of Brazil issued a *decree* which opened the Amazon . . . to the commerce of all the world from and after September 7, 1867.

E. Schuyler, Amer. Diplomacy, p. 342.

Specifically — 2. In *Rom. law*, a determination or judgment of the emperor on a suit between parties. Among the Romans, when all legislative power was centered in the emperors, it became the custom to ask for their opinion and decision in disputed cases. Their decisions were called *decrees*, and formed part of the imperial constitutions.

3. An edict or a law made by an ecclesiastical council for regulating business within its jurisdiction. The term is used in ecclesiastical history chiefly as a designation of certain dogmatic and authoritative decisions on disputed points in theology and discipline in the Roman Catholic Church: as, the *Decrees* of the Council of Trent; the *Decree* of Auricular Confession by the Fourth Lateran Council.

4. A judicial decision or determination of a litigated cause; specifically, the sentence or order of a court of chancery, or of a court of admiralty or of probate, after a hearing or submission of the cause. 5. In *theol.*, one of the eternal purposes of God, whereby for his own glory he has foreordained whatsoever comes to pass. Whether these decrees are absolute or conditional — that is, whether they are according to the counsel of his own will, "without any foresight of faith or good works, or any other thing in the creature, as conditions or causes moving him thereto" (*West. Conf. of Faith*, iii.), or are based upon his foreknowledge of the character and course of his free creatures — is a contested question, the Calvinists taking the former view, the Arminians the latter.

By the *decree* of God for the manifestation of his glory, some men and angels are predestinated unto everlasting life and others foreordained to everlasting death.

West. Conf. of Faith, iii. § 3.

6. The judgment or award of an umpire in a case submitted to him. — **Absolute decree**, a decision that something shall be done with no condition attached to it. — **Berlin decree**, **Milan decree**, two decrees of Napoleon I. against Great Britain, enforcing his continental system. The first, issued at Berlin November 21st, 1806, closed against British commerce all continental ports under the control of France (including those of Italy, Spain, Holland, and Germany), confiscated all British merchandise wherever found, forbade correspondence with Great Britain, and ordered that all British subjects found within the jurisdiction of France or its allies should be made prisoners of war. The second decree, issued at Milan December 17th, 1807, declared all neutral vessels connected in any way with British commerce or intercourse to be thereby denaturalized, and ordered that they should be treated as English. — **Declaratory decree**. See *declaratory*. — **Decree arbitral**, in *Scots law*, an award by one or more arbiters. — **Decree condemnatory**. =Syn. 1. *Decry*, *Depreciate*, *Detract* from, *Derogate* from, *Disparage*, run down, discredit. These words agree in expressing an effort to lower the esteem in which a person or thing is held. If the effort is unjust, the injustice is not so conspicuous as in the words compared under *aspere*. *Decry*, to cry down, clamor against, implies activity and publicity; it is hardly applicable to persons. *Depreciate*, primarily to lower the value of, is less forcible than *decry*, and may apply to persons. *Detract* from and *derogate* from have almost precisely the same meaning — to take from or diminish repute, as by caviling, ascribing success to accident, good conduct to low motives, etc. *Disparage*, to make a thing unequal to what it was in repute; understate. The last four need not have a personal subject: as, it would *derogate* very much from his standing; it would *disparage* him in public estimation if it were known.

Clerk. Why, sir? alas, 'tis nothing; 'tis but so many months, so many weeks, so many —
Gnotho. Do not *deduct* it to days, 'twill be more tedious; and to measure it by hourslasses were intolerable. *Middleton*, *Messinger*, and *Rowley*, Old Law, iii. 1.

4. To take away, separate, or remove in numbering, estimating, or calculating; subtract, as a counterbalancing item or particular: as, to *deduct* losses from the total receipts; from the amount of profits *deduct* the freight-charges.

The late king had also agreed that two and a half per cent should be *deducted* out of the pay of the foreign troops.

Bp. Burnet, Hist. Own Times, an. 1711.

=*Syn.* 4. *Deduct*, *Subtract*. These words cannot properly be used interchangeably. *Deduct* is to lead away, set aside, in a general or distributive sense; *subtract*, to draw off, remove, in a literal or collective sense. In settling a mercantile account, certain items, as charges, losses, etc., are *deducted* by being added together and their total *subtracted* from the grand total of the transaction. From a parcel of goods of known value or number articles are *subtracted* or literally taken away as required; the value or number of the remainder at any time may be ascertained by *deducting* the value or number of those taken from the original package; and this again is effected by *subtracting* the figures representing the smaller amount from those representing the larger.

deductible (dē-duk'ti-bl), *a.* [*< deduct + -ible.*]

1. Capable of being deducted or withdrawn.—

2†. Deducible.

deductio (dē-duk'shi-ō), *n.* [*L.: see deduction.*]

Deduction; specifically, in *music*, the regular succession of notes in the hexachords of the musical system introduced by Guido d'Arezzo, about A. D. 1024. Hence, *deductio prima*, the notes of the first hexachord; *deductio secunda*, the notes of the second hexachord; and so on to *deductio septima*.—**Deductio ad impossibile** (Latin translation of Greek ἀναγωγὴ εἰς τὸ ἀδύνατον, deduction to the impossible), in *logic*, the proof of the falsity of a hypothesis by showing that it leads to a conclusion known to be false.

deduction (dē-duk'shōn), *n.* [*ME. deduccon, < OF. deduction, F. déduction* = Sp. *deducción* = Pg. *dedução* = It. *deduzione*, < L. *deductio* (*n.*), deduction, < *deducere*, lead or take away, deduce, deduct: see *deduce* and *deduct*.] 1†. A drawing or tracing out and setting forth.

Evelyn, To my Lord Treasurer.

2†. The act of deriving; derivation.

To them [vowels], as is well known to etymologists, little regard is to be shewn in the *deduction* of one language from another. *Johnson*, Eng. Dict., Pref.

3. In *logic*, derivation as a result from a known principle; necessary inference; also, the result itself, as so concluded. As a term of logic, it is a translation of Aristotle's ἀνάγωγη (translated *deductio* by Boëthius), and properly signifies an illative descent from a general principle to the result of that principle in a special case; it is especially used by Aristotle when there is a doubt whether the case truly comes under the principle. By the older logicians it is little used, and not with any exact signification. In modern times it has been chiefly employed by those who hold that all reasoning is either a descent from generals to particulars (*deduction*) or an ascent from particulars to generals (*induction*). See *deductive reasoning*, under *deductive*.

Probation may be either a process of *deduction*—that is, the leading of proof out of one higher or more general proposition—or a process of *induction*—that is, the leading of proof out of a plurality of lower or less general judgments. *Sir W. Hamilton*.

Deduction . . . is the inverse process of inferring a particular case from a law of cases assumed to be of like nature. *G. H. Lewes*, Proba. of Life and Mind, 1st ser., III. iv. § 47.

It is astonishing how little of the real life of the time we learn from the Troubadours except by way of inference and *deduction*. *Lowell*, Study Windows, p. 236.

4. The act of deducting or taking away; subtraction; abatement: as, the *deduction* of the subtrahend from the minuend; prompt payment will insure a large *deduction*.—5†. A payment; a statement of payments.

The other Curate, of Luddington, payde by the Warden, as aperrythe above in the *deductions* of the same Colledge. *English Glde* (E. E. T. S.), p. 222.

Deduction for new, in *mercantile law*, the allowance, usually one third, made to one who is required to reimburse or to advance the cost of repairing a damage to a vessel caused by the perils of navigation, the presumption being that the renewed part is better than the old.—**Deduction of a claim**, in *law*, the proof of a right by showing that it results from principles of law or equity.—**Deduction of a concept**, in *Kantian philos.*, the proof that the concept has a meaning—that is, refers to an object.—**Transcendental deduction**, in *Kantian metaph.*, the proof of the objective validity of any concept. = *Syn.* 3. *Conclusion*, *Corollary*, etc. See *inference*.—4. *Subtraction*, *diminution*, *discount*, *tare*.

deductive (dē-duk'tiv), *a.* [= F. *deductif* = Sp. Pg. *deductivo*, < LL. *deductivus*, < L. *deducere*, deduce, deduct: see *deduce* and *deduct*.] 1. Consisting of deduction; of the nature of or based on inference from accepted principles.

We ought therefore to be fully aware of the modes and degree in which the forms of *deductive* reasoning are affected by the theory of probability, and many persons might be surprised at the results which must be admitted. *Jevois*.

Before *deductive* interpretation of the general truths, there must be some inductive establishment of them.

H. Spencer, Prin. of Sociol., § 211.

2. *Deduced*; derived as a conclusion from accepted principles; relating to inference from a principle to the results of that principle in any special case.

He labours to introduce a secondary and *deductive* Atheism: that although men concede there is a God, yet they should deny his providence.

Sir T. Browne, Vulg. Err., i. 10.

Deductive method, in the logical system of J. S. Mill, that mode of investigation by which the law of an effect is ascertained from the consideration of the laws of the different tendencies of which it is the joint result. This method consists of three kinds of operation, the first direct induction, the second ratiocination, the third verification.

To the *deductive method*, thus characterized in its three constituent parts of induction, ratiocination, and verification, the human mind is indebted for its most conspicuous triumphs in the investigation of nature.

Mill, Logic, III. xi. § 6.

Deductive reasoning is commonly opposed to *inductive*, and is meant to include all necessary reasoning (even mathematical induction) together with those probable reasonings which predict results as true in the long run, but excluding those inferences which are regarded as being open to correction in the long run. Thus, if, from counting the letters on a single page, one concludes the proportions of the different letters which will generally be needed in a font of type, the reasoning is *inductive*; but if, knowing what the proportions generally are, one concludes what will be needed in printing a particular book or page, the reasoning is *deductive*.

Deductively (dē-duk'tiv-li), *adv.* By deduction; in consequence of a general principle.

There is scarce a popular error passant in our days, which is not either directly expressed or *deductively* contained in this work [Pliny's Natural History].

Sir T. Browne, Vulg. Err., i. 8.

This result has been attained by a combination of improvements, in which great ingenuity has been displayed, and in which the inventive genius of Sir William Thomson has been particularly conspicuous. The principal features of the most perfect sounding-machine are: (1) the sinker, which is a cannon-ball, through which passes a cylinder provided with a valve to collect and retain a specimen of the bottom, the cylinder being, by an ingenious mechanical arrangement, detached from the shot, which remains at the bottom; (2) the line, made of steel wire, weighing about 14½ pounds to the nautical mile; (3) machinery for regulating the lowering of the sinker and for reeling in the wire with the cylinder attached in such a manner that the irregular strain due to the motion of the ship may be guarded against and the danger of breakage thus reduced to a minimum. In the deepest accurate sounding yet made the bottom was reached at the depth of 4,655 fathoms, but owing to the breaking of the wire no specimen was obtained. This sounding was made on the "Tuscarora" by Commander O. E. Belknap, U. S. N., in north latitude 44° 55', east longitude 152° 26'. The deepest sounding yet made in which a specimen of the bottom was brought up was that of the United States Coast Survey steamer "Blake," off Porto Rico, the depth there reached being 4,561 fathoms.

deer (dēr), *n. sing. and pl.* [Early mod. E. also *deere*, and often *dear, deare*; *< ME. der, deer, < AS. deōr, a wild animal, often in combination, wild deōr, wildeōr, wilder* (whence ult. E. *wilderness*, q. v.), = OS. *dier* = OFries. *diar* = D. *dier* = LG. *deer, deert* = OHG. *tior*, MHG. *tier*, G. *tier*, *thier* = Icel. *dýr* = Sw. *djur* = Dan. *dýr* = Goth. *dīus*, a wild animal. Origin uncertain; perhaps orig. an adj., meaning 'wild,' identical with AS. *deōr*, bold, brave, vehement, OHG. *tiorlih*, wild. (The AS. *deōr*, bold, brave, vehement, was merged later with *deōre*, E. *dear*: see *dear*.) Not connected with Gr. *θηρ*, Æolic *thēr*, a wild beast, or with L. *fērus*, wild, fem. *fēra* (sc. *bestia*), a wild beast (whence ult. E. *fierce, ferocious*). The restricted (but not exclusive) use of the word (for *Cervus*) appears in ME., Icel., Sw., Dan., and G. (in hunters' language), and now prevails in mod. E. It is due to the importance of this animal in the chase. Similarly, in Iceland, *dýr* is applied esp. to the fox, as the only beast of prey. In some parts of the United States the horse, as the most important of a general class, is called simply *beast* or *critter* (*creature*); 'a critter company' is a cavalry company (Prov., U. The largest living deer are the elk of Europe and the moose of America; the smallest are the muntjacs and musk-deer, which are further distinguished by the large tusk-like canine teeth of the males. The term *deer* being so comprehensive, and the animals being so conspicuous, the leading kinds have mostly received distinctive names, as the reindeer, roe-deer, musk-deer, etc. (See these words, and also *brocket, elk, moose, roe, stag, wapiti, caribou, black-tail*.) Deer are found fossil as far back as the Pliocene period. The best-known extinct species is the Irish elk, *Cervus megaloceros*. The leading genera of living deer are *Alece, Rangifer, Dama, Cervus* (with many subgenera), *Capreolus, Cervulus, Moschus*, and *Hydropotes*. The species are numerous, and are found in most continental parts of the world, excepting southern Africa and Australia. The common deer of the United States is *Cariacus virginianus*. =*Syn. 5. Beat, Overpower, Overwhelm, Defeat, Discomfit, Rout, Overthrow*, conquer. *Beat* is general, somewhat indefinite, but vigorous word, covering the others. *Overpower* and *overwhelm* are the least creditable to the one that loses in the struggle: *overpower* is least permanent of strength or numbers, but the disadvantage may be changed by the arrival of reinforcements. To *overwhelm* is to bear down utterly, to sweep clear away by superior strength. *Defeat* is to overcome or get the better of in some kind of contest, and implies less discredit, but generally greater disaster, to the defeated party than *beat*: as, that army is considered *beaten* which withdraws from the field. *Defeat* implies a serious disadvantage, because it applies more often to large numbers engaged. *Discomfit* has fallen into comparative disuse, except in its secondary sense of flogging, etc.; in that it expresses a comparatively complete and mortifying defeat. *Rout* is to defeat and drive off the field in confusion. *Overthrow* is the most decisive and final of these words; it naturally applies only to great persons, concerns, armies, etc. See *conquer*.

And though mine arms should conquer twenty worlds, There's a lean fellow *beats* all conquerors. *Dekker*, *Old Fortunatus*.

2. The act of stating the signification of a word or phrase, or the essential properties of a thing.

Macaulay, *History*.

3. A statement of the signification of a word or phrase, or of what is essential to the conception of any given thing; an explanation of how any given kind is distinguished from all other kinds. Three conceptions of the nature of definition have prevailed at different times: (1) Aristotle taught that every strict definition consists of two parts, different in kind, one declaring the genus or higher class to which the species defined belongs, the other declaring the specific difference by which the given species differs from others of the same genus. This view influences most of the definitions of systematic botany and zoology. (2) The theory of logical extension and comprehension, coming into vogue

on the overthrow of Aristotelianism and attaining its extreme development in the formal logic of Kant and his followers, made the definition a mere list of essential marks all standing upon one footing and aggregated together without any distinction between genus and difference. This, being an extremely nominalistic view, answers very well for the definitions of some artificial classes in mathematics, etc. (3) Modern logicians, recognizing that the elements of a definition are neither, in general, merely joined together without order nor always combined on one fixed model, conceive the definition to be an explanation of the construction of the concept to be defined out of others better known. According to the two first views alike, some concepts are indefinable because so abstract that no wider ones embracing them can be found; according to the third, no concept can be too abstract to admit of definition, the only indefinable ideas being such as the sensation of redness, the sense of fear, and the like, which direct experience alone can impart. An example of definitions conforming to the third conception is: "An *uncle* is the son of a parent of a parent"—a definition in which the notions of *son* and *parent* neither stand in the relation of genus and difference nor are merely aggregated together. Such also is the definition "Substance is the permanent element in the phenomenon."

Though *definitions* will serve to explain the names of substances as they stand for our ideas, yet they leave them not without great imperfection as they stand for things.

Locke, *Human Understanding*, III. xi. 24.

See *causal*.—**Circle in definition**. See *circle*.—**Conceptual definition**, the analysis of a concept; the exact setting forth of the contents of a notion.—**Descriptive definition**, a definition which designates the thing defined by means of inessential attributes.—**Essential definition**, a strict definition stating the true constitutive essence of the definitum.—**Nominal definition**, an explanation of the meaning of a word.—**Real definition**, the statement of the design or idea of a real kind. Thus, any artificial object, as a sewing-machine, is defined by stating the purpose and the nature of the contrivance by which the purpose is intended to be attained. The real definition of a natural species supposes the species to owe its being to some intelligible idea which the definition attempts to state.—**Synthetical definition**, a definition expressing the mode of constructing a new conception; a definition for a new term therein proposed, or for a new sense proposed for an old word.

E. R. Lankester, *Degeneration*, p. 30.

And now to inquire briefly what is meant by *degeneration*. It means literally an unkinding, the undoing of a kind, and in this sense was first used to express the change of kind without regard to whether the change was to perfect or to degrade; but it is now used exclusively to denote a change from a higher to a lower kind: that is to say, from a more complex to a less complex organisation; it is a process of dissolution, the opposite of that process of involution which is pre-essential to evolution.

The theory makes the degeneration chiefly the result of disuse of parts: thus, the cetaceans are descendants from quadrupeds, and have assumed the fish-like form and lost their hind limbs in better accommodating themselves to aquatic life; the smaller-winged and flightless birds are descendants from those with well-developed wings, which, on account of residence in places where they were not much disturbed, have failed to exercise their wings, and finally lost the use of them, and they have aborted; the intestinal worms without an intestine are descendants from those with an intestine, but on account of their environments the skin has assumed the function of a nutrient medium and the intestine has been lost.—**Lardaceous degeneration.** Same as *lardaceous disease* (which see, under *lardaceous*).—**Mucoid degeneration,** the conversion of cells or intercellular substance into a semifluid translucent substance containing mucin.—**Parenchymatous degeneration.** Same as *cloudy swelling* (which see, under *cloudy*).—**Pigmentary degeneration,** disturbance of the nutrition of a part, with deposition of pigment.—**Wallerian degeneration,** the degeneration of nerve-fibres which have been separated, as by section of a nerve, from certain ganglia which exercise a nutritive influence on them.

A reducing in rank; the act of depriving one of a degree of honor, of dignity, or of rank; deposition, removal, or dismissal from rank or office: as, the *degradation* of a general. Specifically—(a) In *eccles. law*, the act of depriving an ecclesiastic of his orders or privileges, or of both. The Roman Catholic Church recognizes two methods of degradation. By the *simple* or *verbal degradation* the accused is deprived of all his orders and benefices. By the *solemn* or *real degradation* he is with great ceremony stripped of his ecclesiastical vestments and ornaments and publicly reproached by the bishop, deprived of his orders and benefices as in simple degradation, and of his various privileges. He remains, however, a priest, and can in special emergencies consecrate and administer the sacraments. Degradation is now resorted to only in extreme cases. In the early church the culprit was degraded by removal from a higher to a lower grade of office. See *deprivation*, 4. (b) The act of depriving a person of his degree in a university. (c) In early American colleges, when the students' names were arranged according to the social rank of the parents, the placing of a name, as a punishment, lower than it would otherwise be placed. *B. Dana.

The course of development may, in particular cases, lead to numerous retrogressions, so that we may find the adult animal to be of lower organization than the larva. This phenomenon, which is known as retrogressive metamorphosis, corresponds to the demands of the selection

theory, since under more simple conditions of life, where nourishment is more easily obtained (parasitism), *degradation* and even the loss of parts may be of advantage to the organism. *Claus, Zoology (trans.)*, i. 158.

Milton, *P. L.*, v. 707.

5. In universities and colleges, an academical rank conferred by a diploma, originally giving the right to teach. The earliest degree was that of *master*, which in the university of Bologna, and others modeled on that (as were the faculties of law in all the old universities), was called the *degree of doctor*. Afterward the lower degree of *determinant* (later called *bachelor*) was introduced, and the intermediate degree of *licentiate*; but these were not regular degrees, except in the faculty of arts. The degree of bachelor was conferred by the "nation" of the faculty of arts; the others were given by the chancellor, by authority of the pope. Thus, the medieval degrees were: (1) the degree of determinant, or bachelor of arts, without a diploma; (2) the license; (3) the degree of master of arts; (4) the degree of master

or doctor of theology; (5) the degree of master or doctor of medicine; (6) the degree of doctor of laws. The degrees now usually conferred are bachelor, master, and doctor: as, bachelor of arts, divinity, music, or law; master of arts; doctor of divinity, law, medicine, philosophy, music, etc.

He [Wolsey] was born at Ipswich in Suffolk, the Son of a Butcher, sent to Oxford by Reason of his Pregnancy of Wit, so soon, that taking there the first *Degree of Art*, he was called the Boy Bachelor. *Baker, Chronicles*, p. 261.

The Universities ceased to teach the systematic theology of the Schools, and the systematic jurisprudence of the Decretals; and the ancient *degrees* of bachelor and doctor of the canon law are known, except during the reign of Mary, no more.

Stubbs, Medieval and Modern Hist., p. 319.

6. In *geneal.*, a certain distance or remove in the line of descent, determining the proximity of blood: as, a relation in the third or fourth *degree*. See first extract, and *forbidden degrees*, below.

In the canon law, *degree* of relationship is reckoned by the number of steps from the person farthest from the common ancestor to him; in the civil law, by the number of steps from one person up to the common ancestor and down to the other. Thus, a grand-uncle is related to his grand-nephew in the third *degree* by the canon law, in the fourth *degree* by the civil. *Stimson*.

She was as familiar as a cousin; hut as a distant one—a cousin who had been brought up to observe *degrees*.

H. James, Jr., Harper's Mag., LXXVI. 342.

7. In *alg.*, the rank of an equation, as determined by the highest power under which an unknown quantity appears in it. Thus, if the exponent of the highest power of the unknown quantity be 3 or 4, the equation is of the third or fourth *degree*.

8. One of a number of subdivisions of something extended in space or time. Specifically—(a) One of a number of equal subdivisions on the scale of a meteorological or other instrument, as a thermometer. (b) A unit for measuring circular arcs and the angles subtended by them at their centers, being the 360th part of a circumference, or the 90th part of a right angle. Considered as angular magnitudes, all *degrees* are equal; considered as lengths of arcs, they are directly proportional to the radii of the circles of which they are parts. This manner of dividing the circle originated with the Babylonians about 2000 B. C., and was brought into use in Greece by the mathematician Hippasides. It was perhaps in its origin connected with an opinion that the year consisted of 360 days. The common abbreviation or sign for "degrees" is a small circle (°) placed to the right of the top of the last figure of the number of them: as, 45°. The degree is subdivided into 60 minutes, and the minute into 60 seconds. The length of a degree of latitude is the length of an arc of the section of the figure of the sea-level by a meridian, the difference of latitude between the extremities of this arc being one degree. (See *latitude*.) It is 68,702 statute miles at the equator, and 69,396 at the poles. The length of a degree of longitude is the length of an arc of the section of the figure of the sea-level by a plane parallel to the equator, the difference of longitude between the extremities of this arc being one degree. This is nearly proportional to the cosine of the latitude, and is equal to 69.16 statute miles at the equator.

Mandeville, Travels, p. 155.

(c) In *arith.*, three figures taken together in numeration: thus, the number 270,800 consists of two *degrees* (more commonly called *periods*). (d) In *music*: (1) One of the lines or spaces of the staff, upon which notes are placed. Notes on the same degree, when affected by accidentals, may denote different tones, as D, D[♯], and D[♭]; and, similarly, notes on different degrees, as D[♯] and C[♯], may denote identical tones, at least upon instruments of fixed intonation. (2) The difference or step between a line and the adjacent space on the staff (or vice versa). Occasionally, through the use of accidentals, this difference is only apparent (see above). (3) The difference, interval, or step between any tone of the scale and the tone next above or below it, as from *do* to *re*, from *mi* to *fa*. The interval may be a whole step or tone, a half step or semitone, or (in the minor scale) a step and a half, or augmented tone. See *step*, *tone*, *interval*, *staff*, *scale*. [To distinguish between degrees of the staff and degrees of the scale, the terms *staff-degree* and *scale-degree* are sometimes used.]

10. In *criminal law*: (a) One of certain distinctions in the culpability of the different participants in a crime. The actual perpetrator is said to be a principal in the *first degree*, and one who is present aiding and abetting, a principal in the *second degree*. (b) One of the phases of the same kind of crime, differing in gravity and in punishment. [*U. S.*]—**Accumulation of degrees.** See *accumulation*.—**By degrees**, step by step; gradually; by little and little; by moderate advances.

Chronic degree, one 360th part of a tropical year.—**Conjunct degrees**. See *conjunct*.—**Degree cut**. See *cut*.—**Degree of a curve**, the same as its *order*, but the latter term is preferable.—**Degree of constraint**. See *constraint*.—**Degree of freedom**. See *freedom*.—**Discrete degrees**. See *discrete*.—**Forbidden or prohibited degrees**, in civil and in canon law, degrees of consanguinity and affinity within which marriage is not allowed. The determination of these in church or canon law was founded on the prohibitions contained in Lev. xviii., with adherence to the principle that a degree of relationship which bars marriage in one sex bars it equally in the other, and that by Christ's declaration (Mat. xix. 6 and Mark x. 8, confirming Gen. ii. 24) a man and his wife become one flesh. The Roman law prohibited nearly the same degrees, though marriage of a man with his niece was permitted from the time of Claudius until forbidden by Nerva, and also from the time of Caracalla to that of Constantine. Marriages with a deceased brother's wife and a deceased wife's sister were forbidden by Constantine. Theodosius the Great forbade them between first cousins, and this was the general rule of the church from that time on. From the sixth to the thirteenth century, marriages within the seventh degree were prohibited; after the fourth Lateran Council (A. D. 1215), only those within the fourth degree. Marriage between godparents and godchildren was prohibited by Justinian, and this was afterward extended to include the parents of the children, and later still other relations of these. The presenter for confirmation was put on a par with the godparents. The Council of Trent limited such spiritual relationship to sponsors, to presenters at confirmation, to the persons baptized or confirmed, and the parents of these. In England marriage between first cousins was forbidden till the Reformation. The present English law of both church and state is confirmed to a statute passed under Henry VIII., and revised under Elizabeth, which forbids all marriages not without the Levitical degrees. These degrees were tabulated by Archbishop Parker in 1563, and his table is adopted in the 99th canon of 1603, and ordered to be set up publicly in every church. It will also be found printed at the end of every English prayer-book. Its provisions have been summarized as follows: A man may not marry the mother or stepmother of his own or his wife's parents; the widow of his father, father-in-law, uncle, brother, son, stepson, or nephew; the aunt, sister, daughter, or niece of himself or his wife; the daughter or stepdaughter of his own or his wife's children. A woman may not marry the father or stepfather of her own or her husband's parents; the widower of her mother, mother-in-law, aunt, sister, daughter, stepdaughter, or niece; the uncle, brother, son, or nephew of herself or her husband; the son or stepson of her own or her husband's children. Marriage with a deceased wife's sister, whether expressly forbidden by the Mosaic law or not, is prohibited as precisely analogous to that with a deceased husband's brother, the marriage of a man with his brother's wife being explicitly prohibited in Lev. xviii. Direct relationship, if in the ascending and descending line, is canonically reckoned as one degree, and marriage prohibited accordingly. In canon law an illicit connection is held to involve the same prohibitions as a marriage.—**In degree**, greatly; to a degree.

He was grieved in degree,
And greatly moved in mynde.

In size and shape the *Delphinidæ* vary greatly. With few exceptions they are marine. As above described, the family includes all the marine cetaceans known as dolphins, porpoises, grampuses, etc., as well as the caaling- or pilot-whales, belugas or white whales, and the narwhal. The flowers are in loose racemes, and are very irregular, consisting of five colored sepals and only two conspicuous petals, the spurs of which are enclosed in the long spur of the upper sepal. There are 50 species or more, scattered over the northern temperate zone, 20 of which are found in the United States. Two species peculiar to California have red or yellowish flowers. Many are cultivated in gardens under the name of larkspur, chiefly *D. Ajacis* and *D. Consolida* of Europe, and *D. elatum* from Siberia, with numerous hybrids. One species, the *D. Delphinus (del-fi'nus), *n.* [*L.*, a dolphin: see *delphin¹* and *dolphin*.] 1. The typical genus of the family *Delphinidæ*, to which very different limits have been assigned. (a) By the authors of the Linnean school it was used for all the cetaceans with teeth in both jaws, and consequently for the *Delphinidæ* (except *Monodon*), *Platanistidæ*, and *Iniidæ*. (b) By later authors it was restricted to *Delphinidæ*, but included at first all except those of the genera *Phocæna* and *Delphinapterus*; gradually others were excluded. (c) By recent authors it is restricted to species of *Delphinina* whose chief peculiarity is in the deep longitudinal grooves on the sides of the palate, separating the alveolar border from the median ridge. They have numerous (more than 80) small pointed teeth, close set along each jaw; from 50 to 90 vertebrae; the rostral part of the skull longer than the cranial portion, whence the head has a pointed snout marked off from the forehead by a groove; the dorsal fin large, triangular or falcate, sometimes wanting; and the flippers of moderate size, narrow, pointed, and falcate, with the lateral digits small or rudimentary. As thus defined, the genus contains the animals to which the word *dolphin* should be restricted, as the original dolphin of the ancients, *Delphinus delphis*, but which are commonly called *porpoises* by confounding them with the species of *Phocæna*, sometimes called *bottle-nosed* or *bay porpoises*. The tursio, *D. tursio*, is a larger and bulkier species. Sundry dolphins marked with white, and having from 80 to 90 vertebrae, constitute a group to which the name *Lagenorhynchus* is applied. A Chinese species, with only about

50 vertebrae, is called *Steno sinensis*. A species from the south seas, *D. peroni*, without a dorsal fin, has been called *Leucorhampus* and *Delphinapterus*. See cut under *dolphin*.

It resembles Alch metal and stero-metal (see these words), the principal difference being that in the manufacture of delta-metal improvements have been made by means of which a fixed percentage of iron can be introduced, which was not the case with the other alloys mentioned, whence these never came into general use. Delta-metal is said to be as strong as mild steel, and to have the great advantage of not rusting. A small steamer has been constructed of this alloy for navigating the rivers of Central Africa. It is said, also, that it has been introduced as a material for rolls in powder-mills because not liable to give rise to sparks as steel rollers do, and that it is coming into use for many other purposes where strength is desired, and where the facility with which steel rusts makes its employment undesirable.

E. A. Freeman, *Amer. Lects.*, p. 388.

=**Syn. 2.** *Illusion, Delusion, Hallucination*. As now technically used, especially by the best authorities in medical jurisprudence, *illusion* signifies a false mental appearance or conception produced by an external cause acting through the senses, the falsity of which is capable of de-

tection by the subject of it by examination or reasoning. Thus, a mirage, or the momentary belief that a reflection in a mirror is a real object, is an *illusion*. A *delusion* is a fixed false mental conception, occasioned by an external object acting upon the senses, but not capable of correction or removal by examination or reasoning. Thus, a fixed belief that an inanimate object is a living person, that all one's friends are conspiring against one, that all food offered is poisoned, and the like, are *delusions*. A *hallucination* is a false conception occasioned by internal condition without external cause or aid of the senses, such as imagining that one hears an external voice when there is no sound to suggest such an idea. If a person walking at twilight, seeing a post, should believe it to be a spy pursuing him, and should imagine he saw it move, this would be an *illusion*; a continuous belief that every person one sees is a spy pursuing one, if such as cannot be removed by evidence, is a *delusion*; a belief that one sees such spies pursuing, when there is no object in sight capable of suggesting such a thought, is a *hallucination*. *Illusions* are not necessarily indications of insanity; *delusions* and *hallucinations*, if fixed, are. In literary and popular use an *illusion* is an unreal appearance presented in any way to the bodily or the mental vision; it is often pleasing, harmless, or even useful. The word *delusion* expresses strongly the mental condition of the person who puts too great faith in an illusion or any other error: he "labors under a *delusion*." A *delusion* is a mental error or deception, and may have regard to things actually existing, as well as to illusions. *Delusions* are ordinarily repulsive and discreditable, and may even be mischievous. We speak of the *delusions* of fancy, hope, youth, and the like, but of the *delusions* of a fanatic or a lunatic. A *hallucination* is the product of an imagination disordered, perhaps beyond the bounds of sanity; a flighty or crazy notion or belief, generally of some degree of permanence; a special aberration of belief as to some specific point; the central suggestion in the word is that of the groundlessness of the belief or opinion.

Poetry produces an *illusion* on the eye of the mind, as a magic lantern produces an *illusion* on the eye of the body. Macaulay, *Milton*.

Dreams or *illusions*, call them what you will, They lift us from the commonplace of life To better things. Longfellow, *Michael Angelo*.

4. A public exhibition, by a number of persons, of sympathy with some political or other cause, as in a mass-meeting or a procession.—5. Proof, either (a) a process of stating in an orderly manner indubitable propositions which evi- dently cannot be true without the truth of the conclusion so proved, or (b) the propositions so stated. Properly, demonstration is restricted to perfect proof, especially mathematical proof. (See the ex- tract from Burgersdicius, below.) According to the Aristote- lian doctrine, which has greatly influenced the use of the word, demonstration must be drawn from principles not only self-evident, but also undervied from any higher principles; and the conclusion must not only be shown to be true, but also to be a mere special case of the truth of one or more of the principles from which it is derived. It was supposed that this was the character of the best mathematical proofs; but mathematical proof consists in constructing a diagram or formula according to certain rules which prescribe that certain relations shall exist between the parts of that diagram, and then in showing by observation (directly or indirectly) that certain addi- tional relations exist between those parts; and no impor- tant mathematical proof is of the nature of the Aristote- lian demonstration. The word has consequently acquired two significations: first, its original sense of a perfect mathematical proof; second, the sense of a proof drawn from principles, as in the Aristotelian theory. There is also a third signification, according to which a demon- stration is any proof which leaves no room for reason- able doubt, such as Kepler's proof that the orbit of Mars is an ellipse. Writers who adopt the Aristotelian view hold that the reductio ad absurdum and the Fermatian mode of proof, though entirely convincing, are not perfect demonstrations.

Some an admirable delight drew to Musick; and some, the certainty of demonstration to the Mathematicks. Sir P. Sidney, Apol. for Poetic.

Demonstration is a syllogism made of such propositions as are true, first immediate, and manifestly known, and be the causes of the conclusion. First and immediate here is all one, signifying such propositions as need not be proved or made more evident by any other former propo- sitions. Bhundeville.

Demonstration, in the Greek ἀποδείξις, is amongst the geometers a delineation of a diagram, in which they exhibit the truth of their propositions to be seen by the eye. To that is opposed pseudographena: that is, a de- scription or false delineation. Now these words, as many others, which are used in the doctrine of syllogism, are translated from geometry into logic; and there demon- stration is taken sometimes for any certain and perspicu- ous proof, but here in this place strictly for syllogism sci- entific, and pseudographena, or false syllogism, for syllo- gism begetting error or contrary to science. Burgersdicius, tr. by a Gentleman.

Demonstration [is] nothing but the perception of such agreement [of ideas] by the intervention of other ideas or mediums. Locke, Human Understanding, IV. iv. 7.

densimeter (den-sim'e-tēr), *n.* [= Sp. *densimetro*, < L. *densus*, dense, + *metrum*, a measure.] An apparatus for ascertaining the specific gravity or comparative density of a solid or liquid, as metals, gunpowder, or sea-water. That used for testing the density of gunpowder consists essentially of a vessel in which the gunpowder is weighed in connection with mercury. The vessel is first partially filled with mercury by creating a vacuum; it is then emptied and a known weight of powder is placed in it, and the mercury again added under the influence of the same vacuum, less being admitted, however, in consequence of the space occupied by the powder. A comparison of the amount of mercury admitted with the weight of the powder gives the specific gravity of the powder. The *optical densimeter* of Hilgard consists of a glass prism for holding salt water, and a collimating telescope for examining a ray of light passing through the water in the prism, the refraction of the light giving the density of the water by comparison with the known angle of refraction of distilled water or sea-water of a known density. *Huck's densimeter* is used for ascertaining the density of syrups while boiling. See *salinometer*.

density (den'si-ti), *n.* [= F. *densité* = Sp. *densidad* = Pg. *densidade* = It. *densità*, < L. *densita(t)-s*, thickness, < *densus*, thick; see *dense*.] 1. The quality of being dense, close, or compact; closeness of constituent parts; compactness, actual or relative.

The density of the ether is greater in liquids and solids than in gases, and greater in gases than in vacuo. *Tyndall, Light and Elect., p. 62.*

2. The mass or amount of matter per unit of bulk. The mass is the ratio of the living force or double the energy of motion to the square of the velocity. Experiments made by Newton upon the effect of attaching masses of different materials to pendulums have shown that the weights of bodies are precisely proportionate to their masses; consequently, the density is measured by the specific gravity, or the weight of a unit bulk. The unit of density is generally taken as that of water at its temperature of maximum density (4° C., 39° F.) and under ordinary pressure. Inasmuch as the gram was intended

to be, and within the limits of the probable error of the best observations actually is, the mass of one cubic centimeter of water under these conditions, it follows that the density as ordinarily expressed is, as closely as possible, the number of grams in one cubic centimeter of the particular kind of matter in question. The following table shows the density of several important substances: iridium, 22.4; platinum, 21.4; gold, 19.3; liquid mercury, 13.6; lead, 11.3; silver, 10.5; copper, 8.9; nickel, 8.7; iron, 7.8; tin, 7.3; zinc, 7.2; the earth, 5.6; solution of iodides of mercury and potassium, 3.2; diamond, 3.5; rock, about 2.7; aluminium, 2.6; sulphur, 2.0; magnesium, 1.7; the human body, 1.1; india-rubber, 1.0; alcohol, 0.8; ether, 0.7; lithium, 0.6; vapor of iodide of arsenic, 1.02; air, 0.0013; aqueous vapor, 0.0008; hydrogen, 0.00009. See *specific gravity*, under *gravity*.

The quantity of matter per unit of space is defined as the density of the mass filling that space.

3. In *elect.*, the quantity of electricity per unit of volume at a point in space, or the quantity of electricity per unit of area at a point on a surface.

The electric volume-density at a given point in space is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the volume of the sphere, when its radius is diminished without limit.

The name *dental* is very imperfectly descriptive, as the teeth bear no important part in producing the sounds in question, and even, in the utterance of many communities, no part at all. Hence some phonetists avoid the term, using instead *lingual*, *lingual-point*, or the like.

The Hebrews have assigned which letters are labial, which *dental*, and which guttural. *Bacon*.

3. Connected with or used in dentistry: as, *dental* rubber; a *dental* mallet or hammer.—**Dental arch**, the curved line of the teeth in their sockets, corresponding to the alveolar border of each jaw. The somewhat parabolic curve of this arch in man, and its continuity, are among the diagnostic zoological characters of the genus *Homo*.—**Dental canal**. See *canal*.—**Dental cartilage**. See *cartilage*.—**Dental cavity**, the natural hollow of a tooth; the pulp-cavity (which see).—**Dental chisel**, cut, drill, file, foramen, etc. See the nouns.—**Dental formula**, a formal or tabular statement of the number and kinds of teeth a mammal may have; a formula of the dentition, in which the letters *i.*, *c.*, *pm.*, and *m.* respectively denote *incisor*, *canine*, *premolar*, and *molar*, and figures are used to indicate the number of each kind of teeth, the figures above a horizontal line (like the numerator of a fraction) referring to the upper jaw, those below to the lower jaw. When the letter *d* is prefixed to *i.*, *c.*, *pm.*, and *m.*, it signifies *deciduous*, and consequently the formula is that of the milk-dentition. The dental formula is usually written in full, as in the subjoined extract; but since there are always the same number of teeth on each side of either jaw, sometimes only each half jaw is indicated; thus, the formula for adult man would be: $i. \frac{2}{2}, c. \frac{1}{1}, pm. \frac{2-2}{2-2}, m. \frac{3-3}{3-3} \times 2 = 32$. See the extract.

The dental formula of a child over two years of age is thus:

$$i. \frac{2-2}{2-2}, dc. \frac{1-1}{1-1}, dm. \frac{2-2}{2-2} = 20;$$

which means that the child should have two incisors, one canine, and two molars, on each side of each jaw. . . . The formula of the permanent dentition in man is written:

$$i. \frac{2-2}{2-2}, c. \frac{1-1}{1-1}, pm. \frac{2-2}{2-2}, m. \frac{3-3}{3-3} = 32;$$

there being two incisors, one canine, two premolars, and three molars on each side above and below.

They are dioecious, headless, eyeless, with a trilobate foot, rudimentary lateral jaws, the mouth surrounded with filiform tentacles; the shell slender, conical, curved, open at both ends, with circular aperture and posterior attachment of the animal; the mantle saccular, open at both ends, the foot being protruded through the larger opening. The larvae are free-swimming and ciliate, with a somewhat bivalval shell, which subsequently becomes tubular. There are about 50 living and upward of 100 extinct species, the latter mostly Devonian. The animals live buried in the mud, where they crawl slowly about. (See *Scaphopoda*, *tooth-shell*.) The family has been divided by recent systematists into various genera, for which the names *Dentalium*, *Antale*, and *Entalis* have been used. Also *Dentaliæ*, *Dentaliidae*.

Different limits have been assigned to it. By the older conchologists it was used for all the *Dentaliidae*, or forms with tusk-like shells; but more recently it has been restricted to *Dentaliidae* with the posterior end of the tusk-like shell furnished with an internal slightly projecting tube provided with a dorsoventrally elongated opening.

From its toothed pungent roots it derives the names of coral-root, toothwort, pepper-root, etc. The flowers are large, white or light-purple.

II. *n.*; pl. *dentaries* (-riz). The distal or symphyseal piece or element of the compound lower jaw of vertebrates below mammals: so called because it bears or may bear teeth. It commonly forms most of the lower jaw as visible from the outside. In birds without teeth it forms about that part of the under mandible which is sheathed in horn. The dentary, as a rule, effects symphysis or unites with its fellow of the opposite side at its distal end; at its proximal end it is articulated or ankyloused with other bones, forming the proximal part of each half of the lower jaw. See cuts under *Cyclodus*, *Gallinæ*, and *temporomastoid*.

dentin, dentine (den'tin), *n.* [= *F. dentine (= It. dentina, < L. den(-t)s, = E. tooth, + -in², -ine².*] The proper substance or tissue of teeth,

as ivory, for instance, as distinguished from enamel, cement, or pulp. Dentin resembles bone, but is ordinarily denser and harder. The difference is seen on microscopic section, when a multitude of very fine close-set tubules or canaliculi (the dentinal tubes) are seen following a parallel straight or wavy course, and no corpuscles or lacunae appear, while bone-tissue shows abundant corpuscles with the canaliculi radiating in every direction. The corpusculated parts of teeth are the softer constituents, as the cement or pulp, for example, whence the canaliculi alone penetrate the dentin, which is therefore comparable to the canalicular substance of bone in a state of extreme density and hardness. See cut under *tooth*.

The notch, neck, or tooth of the bill of the *Dentirostres* is not to be confounded with the tooth of the bill of certain birds of prey, as falcons, nor with the series of teeth of the lamelloirostral birds, as ducks. In very many technically dentirostral birds there is no trace whatever of a notch or tooth.

In Cuvier's system of classification, the first family of his *Passerinae*, "wherein the upper mandible is notched on each side towards the point. It is in this family that the greatest number of insectivorous birds occur, though many of them feed likewise upon berries and other soft fruits." They are contrasted with *Fissirostres*, *Cinostres*, and *Tenuirostres*. The immense assemblage of birds here indicated is definable by no common character, least of all by the one assigned by Cuvier, and the term consequently fell into disuse. It is still employed, however, in a modified sense, for a superfamily group of oscine passerine birds approximately equivalent to the turdoid *Passeres* of Wallace. See *Passeres, Turdidiformes*.

weighings of numerous early coins, has been found equal to 43.7 grains troy, making the value of the coin about 9 United States cents; while the latter is said to be heavier in the ratio of 10 to 9, so that it would be 43 grains. This is still approximately the mass of the derham (weight) in most localities; though in some places it sinks nearly to 46 and in others rises almost to 50 grains, and in Abyssinia is even said to be only 40 or 41 grains. The Morocco coin, the derham, is reckoned equivalent to 7½ United States cents.

It is similar to the crane, but differs from it in having the boom, which corresponds to the jib of the crane, pivoted at the lower end so that it may take different inclinations from the perpendicular. The weight is suspended from the end of the boom by ropes or chains that pass through a block at the end of the boom and thence directly to the crab, a winding-apparatus or motor at the foot of the post. Another rope connects the top of the boom with a block at the top of the post, and thence passes to the motor below. The motions of the derrick are a direct lift, a circular motion round the axis of the post, and a radial motion within the circle described by the point of the boom. On shipboard a derrick is a spar raised on end, with the head steadied by guys and the heel by lashings, and having one or more purchases depending from it to raise heavy weights.—**Floating derrick**, a movable derrick erected on a special boat or vessel. Such derricks have a single central post or support, and a horizontal boom supported at some elevation on the post and carrying a traveling carriage which bears the block from which the load is suspended. Some, however, are permitted to marry and live with their families, but are required to spend at least two nights of each week in the monastery. The novitiate is severe, and the rules of the orders are strict. They are generally divided into two classes, viz.: *spinning* or *whirling dervishes* (*Mevlevi*) and *howling dervishes* (*Rufais*). To the violent circular dances and prouetting of the spinning dervishes the latter add vociferous shouting and cries to Allah. The most important order of dervishes is that of the *Mevlevi*, whose monasteries (Turkish *tekke*) are found at Kouleh in Asia Minor, at Constantinople, and elsewhere.

The lord of the assendent sey that he is fortunat, when he is in god place, . . . and that he be nat retrograd, . . . ne that he be nat in his descencion, ne foignt with no planete in his descencion.

The act of delineating or depicting; representation by visible lines, marks, colors, etc.

The description is either of the earth and water both together, and it is done by circles, or of the water considered by itself; and is not so much a description of that, as of the mariner's course upon it, or to show the way of a ship upon the sea. *J. Gregory*, Posthuma, p. 257.

2. The act of representing a thing by words or signs, or the account or writing containing such representation; a statement designed to make known the appearance, nature, attributes, accidents, or incidents of anything: as, a description of a house or of a battle.

The seventh species of imperfect definition consists of a coacervation or heaping up of circumstances and common adjuncts. And this is properly a description; although use has now obtained that every imperfect definition be called a description. For example: Man is a two-footed animal uncovered with hair or feathers, of an erect countenance, and endued with hands: which formula of definition is used by historians and poets in the description of persons, facts, places, and the like singular things.

(b) *Milit.*, a short military history of each enlisted man, with a description of his person, and an abstract of his account with the government. [U. S.]—**Descriptive muster-roll.** See *muster-roll*.—**Descriptive** (opposed to *metrical*) **property or proposition.** In *geom.*, usually defined to be a property or proposition which can be stated without introducing the idea of magnitude. But it would be better to say that it is a property or proposition which relates to the incidence or coincidence of points, lines, and other geometrical elements, in general, or that it is one which does not depend upon the particular system of measurement adopted. Thus, the

proposition that two triangles are equal if a side and two angles of the one are equal to the corresponding side and angles of the other, may be regarded as descriptive; while the proposition that through any point in space a single parallel to a given line can be drawn, is indisputably metrical, not descriptive.

We have in the plane a special line, the line infinitely; and on this line two special (imaginary) points, the circular points at infinity. A geometrical theorem has either no relation to the special line and points, and it is then *descriptive*; or it has a relation to them, and it is then *metrical*. *Salmon*.

II. n. A desert place or region; a waste; a wilderness; specifically, in *geog.*, a region of considerable extent which is almost if not quite destitute of vegetation, and hence uninhabited, chiefly on account of an insufficient supply of rain: as, the *desert* of Sahara; the Great American *Desert*. The presence of large quantities of movable sand on the surface adds to the desert character of a region. The word is chiefly and almost exclusively used with reference to certain regions in Arabia and northern Africa and others lying in central Asia. (See *steppe*.) The only region in North America to which the word is applied is the Great American Desert, a tract of country south and west of Great Salt Lake, once occupied by the waters of that lake when they extended over a much larger area than they now occupy. The name *Great American Desert* was originally given to the unexplored region lying beyond the Mississippi, without any special designation of its limits. Colonel Dodge, U. S. A., says in "The Plains of the Great West" (1877): "When I was a schoolboy my map of the United States showed between the Missouri River and the Rocky Mountains a long and broad white blotch, upon which was printed in small capitals 'The Great American Desert—Unexplored.' . . . What was then regarded as a desert supports, in some portions, thriving populations." In Fremont's report the Great Basin is frequently spoken of as "the Desert." It is also called the *Great Desert Basin*.

=Syn. *Wilderness, Desert*. Strictly, a *wilderness* is a wild, unclaimed region, uninhabited and uncultivated, while a *desert* is largely uncultivated and uninhabitable owing to lack of moisture. A *wilderness* may be full of luxuriant vegetation. In a great majority of the places where *desert* occurs in the authorized version of the Bible, the revised version changes it to *wilderness*.

A pathless *wilderness* remains

Yet unsubdued by man's reclaiming hand.

A deserving; that which makes one deserving of reward or punishment; merit or demerit; good conferred, or evil inflicted, which merits an equivalent return: as, to reward or punish men according to their *deserts*. 3. In math., the sum of all the products which can be formed of a square block of quantities, each product containing as a factor one number from each row and one from each column of the block, and each product being affected by the plus or minus sign according as the arrangement of rows from which its factors are

taken (these factors being arranged in the order of the columns from which they are taken) requires an even or an odd number of transpositions to reduce it to the arrangement in the square. A determinant is conventionally denoted by writing the square block of quantities between two vertical lines. For example,

$$\begin{vmatrix} A, & B \\ a, & b \end{vmatrix} = Ab - aB.$$

$$\begin{vmatrix} A, & B, & C \\ a, & b, & c \\ \alpha, & \beta, & \gamma \end{vmatrix} =$$

$$A\beta\gamma - A\beta c + a\beta C - a\beta C + aBc - aB\gamma.$$

The different products of which a determinant is the sum are called its *elements*. The different quantities which are multiplied to form the elements are called the *constituents* of the determinant. The oblique line of places from the upper left-hand to the lower right-hand corner is called the *principal diagonal*. The conjugate line of places is called the *secondary diagonal*. The square root of the number of constituents is the ordinal number of the *order* or *degree* of the determinant. — **Adjugate determinant**, one each of whose elements is the cofactor of the corresponding term of the determinant to which it is adjugate. — **Axisymmetric determinant**. Same as *symmetric determinant*. See below. — **Bialar determinant**. See *bialar*. — **Bordered determinant**, a determinant whose matrix is formed from another by adding new rows and columns, especially where a single row and column are added, with a zero at their intersection. — **Centrosymmetric determinant**, one which is symmetric with respect to both diagonals. — **Characteristic determinant** of a matrix, the determinant of a matrix formed from the given matrix by adding the same indeterminate quantity to each constituent of the principal diagonal. — **Complementary determinant**, a determinant related to a partial determinant, to which it is said to be complementary, by having for its constituents all the constituents of the total determinant which belong to rows and columns from neither of which any constituent of the partial determinant has been taken, the sign of the complementary determinant being determined by taking its matrix as it stands in the lower right-hand corner of the matrix of the total determinant, when the matrix of the partial determinant has been brought to the upper left-hand corner, without altering the value of the total determinant. — **Composite determinant**, a sum of determinants whose matrices are obtained by successively omitting all the different combinations of *n*-columns from a rectangular block of quantities having *m*-rows and *m*-and *n*-columns. The composite determinant is usually denoted by writing its oblong matrix with two vertical lines on each side. — **Compound determinant**, a determinant whose constituents are themselves determinants. — **Cubic determinant**, a quantity formed on the analogy of a determinant proper from a cube of quantities as constituents. — **Cyclic determinant**. Same as *circulant*. — **Determinant of a linear transformation or substitution**, the determinant whose constituents are the coefficients of the equations of transformation regularly arrayed. — **Functional determinant**, one in which all the constituents in each row are differential coefficients of one quantity, while all the constituents in each column are differential coefficients with respect to one variable. — **Gauche determinant**. Same as *skew determinant*. See below. — **Minor determinant**, or **minor of a determinant**, a determinant whose matrix is formed from the matrix of another determinant by erasing part of the rows and columns. *First minor*, a minor formed by erasing one row and one column; *second minor*, a minor formed by erasing two rows and two columns, etc. — ***N*-dimensional determinant** of the *n*th order, a function of *n*th constituents, analogous to an ordinary determinant. — **Orthosymmetric determinant**, one all the constituents of which, having the sum of the ordinal places of the row and column the same, are equal. — **Partial determinant**. Same as *minor determinant*. — **Persymmetric determinant**, one which is symmetrical with reference to both diagonals. — **Reciprocal determinant**, a determinant each constituent of which is the corresponding first minor of the determinant of which it is the reciprocal. — **Skew determinant**, one in which every constituent of the *n*th row and *n*th column is in every case the negative of the one in the *n*th row and *n*th column, except on the principal diagonal. Also called *gauche determinant*. — **Skew symmetric determinant**, a skew determinant in which all the constituents of the principal diagonal vanish. — **Symmetric determinant**, one in which the constituent in the *n*th row and *n*th column is in every case equal to that in the *n*th row and *n*th column. — **Zeroaxial determinant**, one in which the constituents of the principal diagonal are all zeros. [The name *determinant* in a narrower sense was introduced by Gauss, and was first applied in the present sense by Cauchy.]

(b) A disquisition or other act substituted in recent times for the old disputation.

The *determinations* were kept in Lent, and hence often called the *Lent determinations*. Originally, in the University of Paris (the model of most of the old universities of northern Europe, and especially of Oxford and Cambridge), there was but one degree, that of master of arts, carrying with it the right to lecture regularly in the university. The purpose of the *determinations* was to enable the masters to judge whether the candidate was fit to be presented to the chancellor as candidate for the mastership; and since there were no examinations, there was no other regular means of ascertaining the candidate's fitness. The baccalaureate was at first called the *determinance*, and was originally not a degree, nor conferred by the university, but merely a permission to *determine* or act as chief respondent in the *Lent disputations*, and was conferred by the "nation." In consequence of this inseparable connection between the baccalaureate and the *determinations*, the latter are often considered as conditions of the former, although they follow in time.

Hence — 13†. A discussion of a question according to the scholastic method, after the model of a disputation.

Another diversity of Method, which is likewise of great weight, is the handling of knowledge by . . . In the American Prayer-book it was the leading canticle in this place till the *Nunc dimittis* was restored in 1886, and has, in turn, the *Benedic, anima mea*, as its alternate.

The great bulk of the yolk of meroblastic ova, as birds' eggs, consists of the nutritive deutoplasm or food-

yolk, as distinguished from the protoplasm or tread, which unakes up into the body of the chick.

In fact, the contents of every egg consist of two parts—(1) of a viscous albuminous protoplasm; and (2) of a fatty granular matter, the *deutoplasm* or food yolk. It has, however, established itself in works on Indian Paleography, and may be conveniently retained to denote that particular type of the Nagari character employed in printed books for the sacred Sanskrit literature, while the generic term Nagari may serve as the designation of the whole class of vernacular alphabets of which the *Devanagari* is the literary type. *Isaac Taylor, The Alphabet*, II. 349.

2. In *photog.*, to induce the chemical changes in (the film of a plate which has been exposed in the camera or of a gelatino-bromide print) necessary to cause a latent image or picture to become visible, and, in the case of a negative, to assume proper density to admit of reproduction by a process of printing.—3. In *biol.*, to cause to go through the process of natural evolution from a previous and lower stage, or from an embryonic state to a later and more complex or perfect one.

Where eyes are so little *developed* that approaching objects are recognized only as intercepting the sunshine, it is obvious that contrasts of light and shade which seem marked to animals with *developed* eyes are quite imperceptible.

H. Spencer, Prin. of Psychol., § 92.

II. *intrans.* 1. To advance from one stage to another by a process of natural or inherent evolution; specifically, in *biol.*, to pass from the lowest stage through others of greater maturity toward the perfect or finished state: as, the fetus *develops* in the womb; the seed *develops* into the plant.

2. In *geom.*, reducible to a plane by bending: applied to a particular species of ruled surface, otherwise called a *torse*, which is conceived as formed by an infinite succession of straight lines, each intersecting the next.—**Developable helicoid.** See *helicoid*.

II. n. In *geom.*, a singly infinite continuous succession of straight lines, each intersecting the next; a *torse*. The word *developable* is used as a noun by modern geometers, because they do not consider this locus to be properly a surface. It is rather a skew curve regarded under a particular aspect.—A developable is generated by a line which turns about a point in itself, while this point moves along the edge of regression of the developable, to which the line is constantly tangent. The developable is thus the locus of tangents of a skew curve. Considering the osculating plane at any fixed point of this curve, the moving tangent comes up to this plane so that for an instant its motion is in the plane and then passes off; and the result is that the curve is a cuspidal edge of the developable considered as a surface.—**Polar developable** of a skew curve, the surface enveloped by its normal planes. The locus of the center of curvature of the skew curve is the edge of regression, while the axis of curvature is the generator of the polar developable.

developed (dē-vel'upt), *p. a.* [Pp. of *develop*, *v.*]

1. Unfolded; laid open; disclosed.—2. In *her.*, same as *discovered*.

Sir E. Creasy, *Eng. Const.*

Specifically, in *photog.*, the chemical bath in which a sensitized plate or paper is, after a photographic exposure to the light, immersed to develop or bring out the latent image. Developers for the ordinary dry-plate process may be divided into two principal classes, *alkaline developers* and *ferrous-oxalate developers*, the first generally employing carbonate of soda or potash in combination with pyrogallie acid, and the second using oxalate of potash with protosulphate of iron. The results obtained are practically the same with either bath, the latent image in the film being made visible, and the chemical changes induced being fixed, or made permanent in the fixing bath, which follows the developing bath. Many other chemicals may be used in development, either in combination with some of those mentioned above or in independent combinations. See *photography*.

M. Balaug claims "that with this chemical he has developed plates without fog in such a light as would have been impossible . . . with other known developers."

Philadelphia Ledger, Feb. 23, 1888.

The internal or subjective process of unfolding or expanding; the coming forth or into existence of additional elements, principles, or substances; gradual advancement through progressive changes; a growing out or up; growth in general: as, the development of the mind or body, or of a form of government; the development of the principles of art or of civilization.

(b) The bending of a surface into a plane, or of all its infinitesimal parts into parts of a plane. (c) The bending of a non-plane curve into a plane curve.—5. In *photog.*, the process by which the latent image in a photographically exposed sensitive film is rendered visible through a chemical precipitation on that portion of the sensitized surface which has been acted on by light. The matter deposited varies with the nature of the process. In the daguerreotype process it is mercury; in negative processes with salts of silver it is silver combined with organic matter.

Compasses are frequently elevated above the deck on tripods or masts to obviate the effects of the ship's magnetism, the direction and amount of which depends to a certain extent upon the position of the ship's head with reference to the points of the compass while building. He is frequently referred to as the Evil One, the prince of the powers of the air, the prince of darkness, Beelzebub, Belial, the tempter, the old serpent, the dragon, etc. He is represented in the New Testament as a person, the enemy of God and of holiness, and bent on the ruin of man, but possessing only limited power, subordinate to God, able to operate only in such ways as God permits, and capable of being made subservient to God's will. In this respect he differs from Ahirman, the evil principle in the dualistic system of the Persians, who was coeval and coordinate with Ormuzd, the spirit of light and goodness, and from the devil of the Gnostic and Manichean systems. The medieval conception of the devil was largely derived from pagan mythology. Then was Jesus led up of the spirit into the wilderness to be tempted of the *devil*. *Mat.* iv. 1. 4. A false god; an idol. [In the authorized version of the Old Testament the word *devil* occurs four times: twice (Lev. xvii. 7; 2 Chron. xi. 15) translating Hebrew *sabim*, rendered in the revised version "he-goats" or "satyrs," and twice (Deut. xxiii. 17; Pa. cvi. 37) translating Hebrew *shedim*, rendered "demons" in the revised version. In the New Testament *δαίμων*, or *demon*, is in one instance (see extract) rendered "devil," in the sense of an object of gentile worship, an idol, a false god.] The things which the Gentiles sacrifice, they sacrifice to *devils*, and not to God. *1 Cor.* x. 20.

7. As an expletive: (a) The deuce: now always with the article *the*, but formerly sometimes with the article *a*, or used absolutely, preceding a sentence or phrase, and serving, like *deuce* and other words of related import, as an ejaculation expressing sudden emotion, as surprise, wonder, vexation, or disgust. [Low.] What a *devil* ails thee? Dost long to be hang'd? *Fletcher*, Humorous Lieutenant, lii. 3. Within. Sir Giles, here's your niece. Hor. "Some refer this to Lincoln Minster (England), over which, when first finished, the devil is supposed to have looked with a fierce and terrific countenance, as incensed and alarmed at this costly instance of devotion. Ray thinks it more probable that it took its rise from a small image of the devil placed on the top of Lincoln College, Oxford, over which he looks, seemingly with much fury." Loss, either partial or entire, of the glassy or vitreous condition, or the process by which this result is attained. The most conspicuous illustration of devitrification is the production of "Réaumur porcelain" from glass by the long-continued action of heat. (See *porcelain*.)

The term *devitrification* is much employed by lithologists in describing the changes which have taken place in rocks consisting originally, either wholly or in large part, of glass. (See *lava* and *obsidian*.)

It may be the result of cooling, during which crystalline products have developed themselves in the glass in greater or less perfection; or it may have taken place in consequence of the action of water, either with or without the aid of heat, after the rocks had become solidified. Pressure is also regarded by many as being an agent of high importance. The changes thus indicated may be begun in a rock during its consolidation, and afterward continued under the combined influence of heat, water, and pressure, even to the entire obliteration of its original vitreous character, the result being the production of a purely lithoid structure. The minute forms developed in the process of devitrification, which are

incipient crystals, or glass beginning to lose its unindustrialized character, have received various names from lithologists, according to their shape and manner of grouping. See *microlith* and *globulite*.

=*Syn.* *Devote*, *Dedicate*, *Consecrate*, *Hallow*, *destine*, *set apart*. In *dedicate* and the cognate words *devote*, *devout*, etc., the root idea is always that of a complete mental consecration; thus, *devotion* (def. 2) is the consecration of the entire mind to God and his worship; and a *devout* (def. 1) spirit is one entirely absorbed in the worship or service of God. To *devote* indicates the inward act, state, or feeling; to *dedicate* is to set apart by a promise, and indicates primarily an external act; to *consecrate* is to make sacred, and refers to an act affecting the use or relations of the thing consecrated; to *hallow* is to make holy, and relates to the character of the person or thing hallowed. Thus, we *devote* ourselves by an act of the mind; we *dedicate* our lives or property by a more formal act; we *consecrate* to sacred uses a building not before sacred; and we *hallow* the name of God, recognizing in it its inherent holy character.

From the Scand. is derived E. dag¹, dew: see dag¹, deg.] 1. The aqueous vapor which is deposited from the atmosphere by condensation, especially during the night, in the form of small drops on the surface of bodies. The formation of dew is explained by the loss of heat by bodies on the earth's surface through radiation at night, by which means they and the air immediately about them are cooled below the dew-point (which see). Dew is thus deposited chiefly on bodies which are good radiators and poor conductors of heat, like grass; hence also it appears chiefly on calm and clear nights—that is, when the conditions are most favorable for radiation. It never appears on nights both cloudy and windy. In winter dew becomes hoar frost.*

It is readily soluble to water and alcohol, has a taste less sweet than ordinary cane-sugar, and directly reduces alkaline copper solution. It is dextrorotatory to polarized light. Dextrose is widely distributed, being found in most sweet fruits, grapes, raisins, cherries, etc., usually associated with levulose. It also occurs sparingly in various animal tissues and juices, and in excessive quantity in diabetic urine. Dextrose is manufactured from starch in large quantity by the action of sulphuric acid. It is used for making cheap syrup, called glucose syrup, in the manufacture of beer, and for adulterating molasses. Also called *dextroglucose, grape-sugar, and starch-sugar*.—**Birotatory dextrose**. See *birotation*.

Among the duties of the dey is mentioned that of feeding the young and weak of a flock or herd with foreign milk; this, in connection with the regular duty of milking the cows, gives some color to the phonetically doubtful derivation from Sw. *dægga*, OSw. *dægga*, suckle, = Dan. *dagge*, feed with foreign milk, eade, coddle (prob. not connected with Sw. *dä* = Dan. *die*, suck, = AS. ppr. di-². [L., etc., *di-*, < Gr. *di-*, two-, double, combining form of *dic*, adv., twice, doubly (= L. *bis*, *bi-* = Skt. *dvi-* = E. *twi-*, etc.), < *diō* = E. *two*: see *bi-²*, *twi-*, *two*.] A prefix of Greek origin, cognate with *bi-²* (which see), and meaning 'two-,' 'twofold,' 'double,' as in *dipterous*, two-winged, *diptych*, a two-leaved tablet, *diarchy*, government by two, etc. In chemistry it denotes that a compound contains two units of the element or radical to which *di-* is prefixed: as, manganese dioxide, MnO₂, a compound of one atom of manganese and two of oxygen.

diabase (di'a-bās), *n.* [C. *dia-*, erroneously for *di-²*, double, + *base²*.] The form simulates Gr. *diábasos*, a crossing over, < *diabavein*, go through or over, < *diá*, through, + *basein*, go: see *basis*.] The name originally given by A. Brongniart to a rock which Haüy later designated as *diorite*, which name Brongniart himself adopted in preference to that of *diabase*. Later (in 1842) Haismann again introduced the word *diabase*, and by it designated a variety of pyroxenic rock, occurring in the Harz, and characterized by the presence of chlorite in considerable quantity. At the present time the name *diabase* is used to designate a crystalline-granular rock, consisting essentially of augite and a triclinic feldspar, with more or less magnetite or titaniferous iron, or both, and occasionally apatite or olivin, to which is added chloritic matter in varying amount. To this chloritic material the name *viridite* is frequently applied, this being the substance which gives the mass the greenish color which it frequently has. Diabase is one of the rocks included under the popular designation of *greenstone*, and also under that of *trap*. It is an altered form of basalt. "The main difference between *diabase* and *basalt* appears to be that the rocks included under the former name have undergone more internal alteration, in particular acquiring the diffused 'viridite' so characteristic of them" (*Geikie*, 1885). See *greenstone*, *trap*, *diorite*, and *melaphyre*.

The former is distinguished by the presence of an excessive quantity of sugar in the urine, and to it there is a strong tendency to restrict the name. Light and evanescent grades of glucosuria are not considered as diabetes, and doubtless frequently have an entirely different causation. The disease is chronic and generally fatal. Its essential pathology is unknown. It is not an affection of the kidneys, but depends upon the accumulation of sugar in the blood, or glycohemia. (See *glycosuria*.) *Diabetes insipidus*, or polyuria, is characterized by the discharge of abnormally large quantities of ordinary or watery urine.

It is used to contain vestments, sacred vessels, etc., and thus corresponds to the sacristy of a Western church. Other names for it are *metatorium* and *scuophylacium*. The diacoon and prothesis are found in early times comprehended under the common name of *pastophoria*. See *cut* under *bema*.

The area of the diagram measures the total work performed by the piston during the stroke. This work, expressed in foot-pounds, divided by Joule's equivalent, gives the heat-equivalent of the work performed, in British thermal units. (See *indicator*.) 2. One of a number of related modes of speech, regarded as descended from a common original; a language viewed in its relation to other languages of the same kindred; the idiom of a district or class, differing from that of other districts or classes. Thus, the Scotch is a dialect of English; English is a dialect of the Germanic or Teutonic group; Germanic speech is an Aryan or Indo-European dialect. Of the various dialects of Greek—Attic, Ionic, Doric, Æolic, and so on—the Attic finally became the common dialect of all cultivated Greeks. Every literary language is originally one of a body of related dialects, to which favoring circumstances have given vogue and general acceptance.

The Dane was converted; he sank into the general mass of Englishmen; his tongue became simply one of the local *dialects* of English. *E. A. Freeman*, Amer. Lects., p. 152.

II. *n.* [= *F. dialectique* = *Sp. dialéctica* = *Pg. dialectica* = *It. dialettica* = *G. Dan. Sw. dialektik*, < *L. dialectica*, < *Gr. διαλεκτική* (se. *τέχνη*), the dialectic art, the art of discussion, logical debate, also the logic of probabilities, fem. of *διαλεκτικός*, belonging to disputation: see I.] 1. Logic, or a branch of logic; specifically, the art of critical examination into the truth of an opinion; inductive logic applied to philosophy; the logic of probable reasoning; the art of discussion and of disputation; logic applied to rhetoric and refutation. The invention of the art of dialectic is attributed to Zeno the Eleatic, whose arguments against motion are examples of the original meaning of the Greek word. The famous dialectic of Socrates and Plato, their chief instrument of philosophical inquiry, was a conversational discussion with inductive appeals to special instances. Dialectic was limited by Aristotle to logic accommodated to the uses of the rhetorician, appealing only to general belief, but not to first principles. The Stoics, who probably introduced the term *logic*, divided that art into rhetoric and dialectic, the former being the art of continuous discourse, the latter that of discussion with an interlocutor. Cicero and other Latin writers, influenced by Stoic doctrine, understand by dialectic "the art of discussing well" (*ars bene disserendi*). It thus became the name of that branch of the trivium of the Roman schools which we call logic, and retained that meaning throughout the middle ages. Hence, in all the earlier English literature, it is the synonyma of *logic*, differing from that word only by a more distinct suggestion of the idea of disputation. Modern logicians have frequently restricted it to the doctrines of the Topics and Sophistical Elenchi, or to the former alone. It has also been used as a synonym of *sylogistic*. Kant named the constructive part of his Transcendental Logic *transcendental analytic*, and the destructive part *transcendental dialectic*. For the sake of this phrase, he makes dialectic, in general, the theory of fallacies. According to Hegel, each concept in the development of thought by a primitive necessity develops its own diametrical opposite, and to this reaction of thought against itself, regarded not as final, but as subject to a subsequent reconciliation in a higher order of thought, he gave the name of *dialectic*.

There hath not been, to my understanding, sufficiently inquired and handled the true limits and use of reason in spiritual things, as a kind of divine *dialectic*.

Bacon, Advancement of Learning, ii. 364.

We termed *Dialectic* in general a logic of appearance. This does not signify a doctrine of probability; for probability is truth, only cognized upon insufficient grounds, and though the information it gives us is imperfect, it is not therefore deceitful. *Kant*, tr. by Meiklejohn.

St. Paul, though bred in the *dialectic* of the Greek schools, came late by his conversion to the new faith, and remained a Jew to the last. *Alcott*, Table-Talk, p. 99.

It remains true that the value of the *Dialectic* which asks and gives such an account of ideal good as at once justifies and limits obedience to practical authorities is conditional upon its finding in the individual a well-formed habitual morality.

T. H. Green, Prolegomena to Ethics, § 283.

In *anat.*, separation of parts in general; dissolution of continuity of parts previously united.—4. In *med.*, loss of strength; weakness of the limbs.—5. In *chem.*, the act or process of separating the soluble crystalloid substances in a mixture from the colloid, depending on the principle that soluble crystalloid bodies will diffuse readily through a moist membrane, while colloids diffuse very slowly, if at all.

This is done by pouring a mixed solution of crystalloid and colloid on a sheet of parchment-paper stretched over a wooden or gutta-percha hoop, having its edges well drawn up and confined by an outer rim. The parchment is allowed to float in a basin of water. Diffusion immediately commences, the crystalloid passing through and dissolving in the water beneath, while the colloid remains behind. Thus, Gruel or broth containing a very little arsenic dissolved in it gives up the whole of its arsenic to the water, while scarcely a trace of the organic substance passes through. As almost all the poisons in common use—arsenic, corrosive sublimate, oxalic acid, lead acetate, morphia, and salts of strychnine, etc.—are crystalloids, the toxicologist is by this process furnished with an easy mode of detecting their presence, if they are in a form readily soluble in water.

diamagnetism (dī-a-mag'net-izm), *n.* [= F. *diamagnétisme*; as *diamagnet-ic* + *-ism*.] 1. The phenomena exhibited by a class of substances which, when under the influence of magnetism and freely suspended, take a position with the longer axis at right angles to the magnetic lines of force. From the experiments of Faraday it appears to be clearly established that all matter is subject to the magnetic force as universally as it is to the gravitating force, arranging itself into two divisions, the *paramagnetic* and the *diamagnetic*. Among the former are iron, nickel, cobalt, palladium, titanium, and a few other substances; and among the latter are bismuth, antimony, cadmium, copper, gold, lead, mercury, silver, tin, zinc, and most solid, liquid, and gaseous substances. When a paramagnetic substance is suspended freely between the poles of a powerful horseshoe magnet, it points in a line from one pole to the other, which Faraday terms the *axial line*. On the other hand, when a diamagnetic substance is suspended in the same manner, it is repelled alike by both poles, and assumes an equatorial direction, or a direction at right angles to the axial line.

The magnetism of two iron particles lying in the line of magnetization is increased by their mutual action, but, on the contrary, the *diamagnetism* of two bismuth particles lying in this direction is diminished by their mutual action. *J. E. H. Gordon, Elect. and Mag., II, 21.*

If, however, the magnetism of the molecules were so much increased that they held each other tight, and so could not be turned round by ordinary magnetizing forces, it is shown that effects would be produced like those of *diamagnetism*. *W. K. Clifford, Lectures, I, 241.*

In *geom.*, a chord of a circle or a sphere which passes through its center; in general—(a) a chord of a conic cutting it at points tangents to which are parallel; (b) a line intersecting a quadric surface at points where the tangent planes are parallel. The conception was extended by Newton to other algebraic curves by means of the following theorem:

a, Diameter of a Circle.

In *arch.*, the diameter of the lower face of the shaft of a column, divided into 60 parts, forms a scale by which all the parts of a classical order are commonly measured. The 60th part of the diameter is called a *minute*, and 30 minutes make a *module*.

2. A precious stone, distinguished from all others by being combustible and by its extreme hardness, as well as by its superior refractive and dispersive power. It consists of pure or nearly pure carbon, leaving only a very small quantity of ash when burned. Its specific gravity is about 3½; its crystalline form is the isometric, and it cleaves readily in planes parallel to the faces of the regular octahedron.

Natural crystals are found in a great variety of forms belonging to the isometric system. The crystalline planes of the diamond have this peculiarity, that they are frequently more or less convex, instead of being flat, as those of crystals usually are. The range of color of the diamond is extensive, but hues of light yellow, or straw-color, and brown are of most common occurrence. Diamonds of a decided color, such as green, blue, or even red, are found, but they are extremely rare; only one deep-red diamond is known. A diamond is of the *first water* when it is without flaw or tint of any kind. The value of the gem increases in an increasing ratio with its weight up to a moderate size; beyond that there is no fixed value. A first-water diamond of one carat being considered worth \$100, one of two carats would be held at \$300, and one of ten at \$11,000. The most desirable form in which the diamond may be cut is called the *brilliant*. (See cuts under *brilliant*.) Diamonds formerly came chiefly from India, and later from Brazil; the present principal source of supply is southern Africa, where they are found associated with a peculiar rock of unequivocal volcanic origin. In all other diamantiferous regions diamonds have been found only in the surface detrital material (gravel and sand), or else, rarely, in rock of fragmental origin. See *bort*.

diamond-cutting (dī'a-mōnd-kut'ing), *n.* One of three processes by which diamonds are prepared for use as ornaments or in the arts, the others being diamond-cleaving and diamond-polishing. Diamond-cutting is performed by rubbing together two diamonds secured with shellac in wooden holders or handles, one of which is held in each hand of the cutter over the edge of a box called a cutters' box, into which the dust is allowed to fall. This rubbing is continued until each diamond assumes the proper outline, whether brilliant, rose, or briolette, the smaller facets being afterward made by polishing. Both stones are cut at the same time, irrespective of size or shape, or of the outline to be produced. Diamond-cutting is sometimes performed by machinery. In this case one of the handles or dops is stationary and the other is moved backward and forward, both diamonds being cut at the same time, but more rapidly and accurately than by hand.

Such diaphragms are often made movable, especially for photographic lenses, so that one with a large opening may be inserted when it is desired to admit abundant light to the lens, in order to use a short exposure, and one with a small opening when sharpness of detail is more desirable than shortness of exposure.

3. In *anat.*, the midriff; the musculomembranous partition which separates the thoracic from the abdominal cavity in mammals. In man the diaphragm consists of a muscular sheet whose fibers

radiate from a trefoil tendinous center to attach themselves to the lower margins of the thorax, and behind form a large bundle on either side, called *pillars of the diaphragm*. The diaphragm is pierced by three principal openings: the *esophageal*, for the passage of the esophagus accompanied by the pneumogastric nerves; the *aortic*, for the passage of the aorta, thoracic duct, and large azygos vein; and the *caval*, for the inferior vena cava; besides some others for splanchnic nerves, etc. The diaphragm is invested on its thoracic surface by the pleural and pericardial serous membranes; on its abdominal surface by the peritoneum, a fold of which, reflected upon the liver, forms the suspensory ligament of that organ. The diaphragm is deeply concavo-convex, the convexity upward; the general figure is that of an umbrella. It is a powerful respiratory muscle, contracting at each inspiration and so flattening, while its relaxation in expiration renders it more convex; its contraction also assists in defecation and in parturition, and its spasmodic action is concerned in hicough and sneezing; when most relaxed it rises to the level of about the fifth rib. A rudimentary diaphragm exists in birds; it is best developed in the apteryx.

It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of 113°, a certain quantity of germinated barley ground and dried in the open air, and then putting the whole under pressure and filtering it. Diastase is solid, white, and soluble in water and diluted alcohol, but insoluble in strong alcohol. In solution it possesses the property of causing starch to break up at the temperature of 150°, transforming it first into dextrin and then into sugar.

diastasis (dī-as'tā-sis), *n.*; pl. *diastases* (-sēz). In *zool.* and *anat.*, an interval between any two consecutive teeth, especially between any two series or kinds of teeth, as between the canines and premolars or incisors, or among the incisors, as in many bats. When there are no canines, as in rodents, diastema occurs between the incisors and the premolars. It necessarily occurs when opposing teeth are so long that they cross each other when the mouth is shut. Man is notable as having normally no diastemata, his teeth forming a continuous series, and being all of approximately equal lengths. But the same is the case with many other mammals, as in the genera *Tareius* and *Anoplotherium*.

2. In *anc. Gr. music*, an interval. Also *diastem*.

diaster (dī-as'tēr), *n.* [*< Gr. δι-, two-, + ἀστήρ, star.*] In *biol.*, a double star; the caryocentric figure which results from the aster of a nucleus before this separates into two nuclei. See *aster* and *caryocinesis*. Also *dyaster*.

diastole (dī-as'tō-lē), *n.* [LL., < Gr. διαστολή, dilatation, expansion, lengthening of a syllable, < διαστέλλω, dilate, expand, put asunder: see diastaltic.] 1. The normal rhythmical dilatation or relaxation of the heart or other blood-vessel, which alternates with *systole* or contraction, the two movements together constituting pulsation or beating: as, auricular *diastole*; ventricular *diastole*. The term is also extended to some other pulsating organs, as lymph-hearts, and specifically to the expanding action of the contractile vesicle of infusorians and other protozoans.

2. The period or length of time during which a rhythmically pulsating vessel is relaxed or dilated; the time-interval which alternates with *systole*.—3. In *Gr. gram.*, a mark similar in position and shape to a comma, but originally semicircular in form, used to indicate the correct separation of words, and guard against a false division, such as might pervert the sense. Such a sign was needed to obviate the confusion arising from the ancient practice of writing without division between words. The diastole is still occasionally used, generally in order to distinguish the pronominal forms *ὄν, ἕν, ἓν*, 'whatever, which,' from the particles *ὄν, ἕν, ἓν*, 'that, and, when.' The usual practice at present, however, is to use a space instead of the diastole. When the present shape of the comma came into use, more or less confusion between it and the diastole necessarily ensued. Also called *hypodiastole*. See *hypen*.

4. In *anc. pros.*, lengthening or protraction of a syllable regularly short; especially, protraction of a syllable preceding a pause or taking the ictus: as,

Ire negabamūs et tecta ignota subire.
Ovid, Metamorph., xiv. 250.

Most cases of diastole in Latin poetry are supposed to be instances of reversion to an older pronunciation, though the pause which usually follows could of itself make good the metrical deficiency. This reversion is seen chiefly in verb-terminations with final t and r: as,

Callidus ut soleat humeris portare viator.
Horace, Satira, l. v. 90.

As understood by recent naturalists, it is limited to *Diastylis* and *Leptostylis*; these have the integuments strongly indurated, body and tail sharply defined, and the carapace large and vaulted, with a conspicuous rostriform prominence.

If these undeveloped branches lie always upon the same side of the axis, the *sympodial* dichotomy is *helictoid*; if alternately upon opposite sides, it is *scorpioid*.—**Argument from dichotomy**, one of the arguments of Zeno the Eleatic against plurality and magnitude. dicotyledon (di-kot-i-lē'don), *n.*; pl. *dicotyledons* (-donz) or *dicotyledones* (-dō-nēz). [< Gr. *di-*, two-, + *κοτυλήδων*, a cavity: see *cotyledon*.] A plant which produces an embryo having two cotyledons. *Dicotyledons* form a natural class of the phænogamous series of plants, characterized by the two opposite cotyledons, an exogenous mode of growth, and a netted venation of the leaves, and by seldom having a trimerous arrangement of the parts of the flower. From the structure of the stem, increasing by external growth, they are also known as *exogens*. The gymnosperms, in which the embryo has several cotyledons in a whorl, are usually included as a subclass, but by some recent botanists they are ranked as a distinct class. According to the more usual arrangement, the angiospermous dicotyledons are divided by the characters of the perianth into *Polypetalæ*, *Gamopetalæ*, and *Apetalæ* or *Monochlamydeæ*. These are subdivided into 164 orders. Several modifications of this system have been adopted, especially by continental European botanists, the most important of which is the distribution of the apetalous orders among the two other divisions. The total number of species of dicotyledonous plants now known is about 80,000, included under about 6,000 genera. See *exogen*.

The canines are acute and trenchant, simply decurved, not twisted outward, as in the males of ordinary swine, and the condyles of the lower jaw are simply transverse.

Dicranobranchia (di-kra-nō-brang'ki-ā), *n. pl.* [NL., < Gr. *δίκρανος*, two-headed (see *Dicranum*), + *βράγχια*, gills.] A suborder of rhipidoglossate gastropods. The gills are in two symmetrical dorsal plumes (whence the name); the body and shell are not spiral; the foot is slightly bearded; the eyes are sub-sessile; and the median teeth of the odontophore are of two kinds, the inner being small and similar, and the outer large and dissimilar. First used, it is said, by Joannes de Garlandia (died about A. D. 1250), the compiler of a *dictionary*, a classified list of words. Exactly equiv. in etymological meaning are *vocabulary*, *lexicon*, and *word-book*.] I. *n.*; pl. *dictionary* (-riz). A book containing either all or the principal words of a language, or words of one or more specified classes, arranged in a stated order, usually alphabetical, with definitions or explanations of their meanings and other information concerning them, expressed either in the same or in another language; a word-book; a lexicon; a vocabulary: as, an English *dictionary*; a Greek and Latin *dictionary*; a French-English or an English-French *dictionary*. In the original and most usual

sense a dictionary is chiefly linguistic and literary, containing all the common words of the language with information as to their meanings and uses. In addition to definitions, the larger dictionaries include etymologies, pronunciation, and variations of spelling, together with illustrative citations, more or less explanatory information, etc. Special or technical dictionaries supply information on a single subject or branch of a subject: as, a *dictionary of medicine* or of mechanics; a biographical *dictionary*. A dictionary of geography is usually called a *gazetteer*.

What speech esteem you most? The king's, said I. But the best words? O, Sir, the *dictionary*.

Pope, Donne Versified, iv.

The multiplication and improvement of *dictionaries* is a matter especially important to the general comprehension of English. G. P. Marsh, Lects. on Eng. Lang., xxi.

=Syn. *Glossary*, *Lexicon*, etc. See *vocabulary*.

[= F. *dictum* = Sw. *dictum*, < L. *dictum*, something said, a word, a witty saying, a proverb, an order, neut. of *dictus*, pp. of *dicere*, say: see *diccion*. In older E. form *dict*, q. v.] 1. A positive or judicial assertion; an authoritative saying.

Critical *dicta* everywhere current. M. Arnold.

In spite of Dr. Johnson's *dictum*, poetry is not prose, and . . . verse only loses its advantage over the latter by invading its province. Lowell, Among my Books, 2d ser., p. 180.

The authoritative Native Ireatles on law are so vague that, from many of the *dicta* embodied by them, almost any conclusion can be drawn. Maine, Village Communities, App., p. 393.

There is no error in maintaining that the voice is given us for speech, if only we do not proceed to draw from such a *dictum* false conclusions as to the relation between thought and utterance. Whitney, Encyc. Brit., XVIII. 767.

2. In law, an opinion of a judge which does not embody the resolution or determination of the court, and is made without argument, or full consideration of the point, and is not the professed deliberate determination of the judge himself. Chief-Justice Folger.—3. In logic, that part of a modal proposition which consists of the proposition to which the modality is applied.

It is necessary that God be good. The *dictum* is that God be good, the mode, necessary. Burgersdicius, tr. by a Gentleman.

Dictum de omni et de nullo (concerning every and none) the rule of direct syllogism that if all A is B and all B is C, then all A is C. Some logicians render this as comprising two *dicta*: the *dictum de omni*, that whatever is true of all is true of each, and the *dictum de nullo*, that whatever is true of none is false of each. The canon is given by Aristotle.—**Dictum of Kenilworth**, an award designed for the pacification of the kingdom, made between King Henry III. of England and Parliament in 1266, during the siege of Kenilworth. It is published among the statutes of the realm, I. 12.—**Dictum simpliciter**. See *simpliciter*.—**Obiter dicta**, legal *dicta* (def. 2) uttered by the way (*obiter*), not upon the point or question pending, as if turning aside for the time from the main topic of the case to collateral subjects.—Syn. 1. *Aphorism*, *Axiom*, *Maxim*, etc. See *aphorism*.

Dictyocysta (dik'ti-ō-sis'tā), *n.* [NL., < Gr. *δίκτυον*, a net, + *κύστις*, bladder.] The typical genus of *Dictyocystida*, containing pelagic free-swimming animalcules with a fenestrated silicious lorica and tentaculiform cilia. *D. cassis* and *D. elegans* are examples. Ehrenberg.

dictyogen (dik'ti-ō-jen), *n.* [< Gr. *δίκτυον*, a net, + *γενε*, producing: see *-gen*.] A member of a division of plants proposed by Lindley to include such endogenous genera as have net-veined leaves. They belong chiefly to the *Disoscoriaceae* and to some tribes of the *Liliaceae*.

Dictyograptus (dik'ti-ō-grap'tus), *n.* [NL., < Gr. *δίκτυον*, a net, + NL. *Graptus*.] A genus of widely distributed and important fossils, originally described by Eichwald under the name of *Gorgonia flabelliformis*, and later by Hall under that of *Dictyonema*, and by him at that time (1852) considered to be corals, having a structure similar to that of *Fenestella*. Later the name *Dictyograptus* was substituted for *Dictyonema*. This fossil has been considered by some as a plant, but is now referred to the graptolites, from which it differs but slightly, if at all. *Dictyograptus* is "one of the most charac-

teristic fossils of the primordial zone of Scandinavia" (*Geikie*), and is found in many localities in the shales of the Niagara group, from Rochester to the Niagara river.

(Zittel), < Gr. *δίκτυον*, a net, + *-ina*².] A suborder of hexactinellid silicious sponges, whose parenchymal hexacts unite in a regular firm skeleton: contrasted with *Lyssacina*. The families *Fareidae*, *Euretida*, *Mellitoniada*, *Cuscinioporidae*, *Tretodictyidae*, and *Meandrospingiadae* compose the suborder.

dictyonine (dik'ti-ō-nin), *a.* Of or pertaining to the *Dictyonina*. Also *dictyonal*.

Dictyophyllum (dik'ti-ō-fl'um), *n.* [NL., < Gr. *δίκτυον*, net, + *φύλλον* = L. *folium*, leaf.] A genus of fossil ferns established by Lindley and Hutton, remarkable for its double system of nervation, consisting of a system of larger meshes inclosing another system of smaller ones, the whole bearing considerable resemblance to leaves of dicotyledonous plants.

Hence some fossil leaves really belonging to the dicotyledons have, probably by mistake, been referred to this genus. Some authors are at present inclined to regard *Dictyophyllum* as a convenient name under which to place the description of fragments of doubtful character considered as belonging to the ferns. See *Idiophyllum* and *Phyllites*.

Dictyophyton (dik-ti-ōf'i-ton), *n.* [NL., < Gr. *δίκτυον*, a net, + *φύτον*, a plant.] The name given by Hall to a genus of remarkable fossils of obscure affinities, which have been compared with algae of the family *Dictyotaceae*. It is also considered as being closely related to, or identical with, the genus *Uphantonia* of Vanuxem. The latter genus exhibits itself in the form of circular or flabellate fronds, made up of ligulate, radiating, and concentric bands or striae, which have the appearance of being interwoven like basketwork. With these flabellate forms are associated others which are conical or cylindrical, marked externally by cross striae which divide the surface into rectangular spaces, and sometimes covered with long tubercles arranged in vertical and transverse rows. These latter forms are those which Hall included under the generic name of *Dictyophyton*. They are found in the Chemung group (Devonian) in New York, and in the Waverly group (Lower Carboniferous) of Ohio.

Dictyoptera (dik-ti-ōp'te-rā), *n. pl.* [NL., < Gr. *δίκτυον*, a net, + *πτερόν*, a wing.] A group of cursorial orthopterous insects, the cockroaches, *Blattide* or *Blattina*, elevated to the rank of an order. Leach; Burmeister.

It is abundant in the coal-measures of Europe and the United States.

Dictyopyge (dik'ti-ō-pi'jē), *n.* [NL., < Gr. *δίκτυον*, a net, + *πυγή*, buttocks.] A genus of Triassic ganoid fishes, remains of which occur in the coal-fields of Virginia: so called from the reticulated appearance of the large anal fin. Lyell, 1847.

Dictyotaceae (dik'ti-ō-tā'se-ē), *n. pl.* [NL., < Gr. *δίκτυωτός*, netted, latticed (< *δίκτυον*, a net), + *-aceae*.] An order of olive-brown algae with expanded membranous fronds. In their reproductive characters they are intermediate between the *Florideae* on the one hand and the *Fuaceae* and *Phaeosporae* on the other.

Dictyotææ (dik-ti-ō-tā'se-ē), *n. pl.* [NL., < Gr. *δίκτυωτός*, netted, latticed, + *-ææ*. See *Dictyotaceae*.] Same as *Dictyotaceae*.

Leaf of *Dictyopteris Brongniarti*, and portion of same on larger scale. (From Weiss's "Flora der Steinkohlenformation.")

The leaf-scars of dictyoxylon are subpentagonal in form, broader than they are long, and have a slight groove at the upper end.

dicyan, **dicyanogen** (di-sī'an, dī-sī-an'ō-jen), *n.* [*< di-² + cyan(ogen).*] See *cyanogen*.

Dicyema (dis-i-ō'mā), *n.* [NL., *< Gr. di-, two-, + κίημα, an embryo, a fetus, < κείν, be pregnant.*] A remarkable genus of ciliated filiform parasites found in the renal organs of cephalopods. The body consists of an elongated axial cell extending from one end to the other, invested in a single layer of comparatively small, flattened, nucleated, and ciliated cortical cells arranged like a pavement epithe-

lium around the axial cell, the anterior of these, or polar cells, being distinguished from the succeeding or parapolar cells. The organism is a simple cell-aggregate, without connective, muscular, or nervous tissues. Reproduction takes place by the formation of germs on the axial cell. The embryos are of two different kinds, vermiform and infusoriform, whence the name. Those *Dicyemida* which give rise to the former kind are termed *Nematogena*, the others *Rhombogena*.

Dicyemida (dis-i-em'ī-dā), *n. pl.* [NL., *< Dicyema + -ida.*] A division of animals proposed to be established by E. Van Beneden for the genus *Dicyema*, which has no mesoblastic layer, and is therefore regarded as intermediate between the *Protozoa* and the *Metazoa*.

Dicynodon (dī-sin'ō-don), *n.* [NL., *< Gr. di-, two-, + κίων (κν-), dog (= E. hound), + ὄδους (όδου-)= E. tooth.*] The typical genus of *Dicynodontidæ*. Remains of species have been found in southern Africa, in the Ural mountains, and in India, in strata supposed to be of Triassic age.

Dicynodontia (dī-sin'ō-don'shi-ā), *n. pl.* [NL., *pl. of dicynodon(-):* see *Dicynodon*.] I. An order of extinct reptiles, probably of the Triassic period, remains of which have been found in Asia and Africa: a synonym of *Anomodontia*. There are two genera, *Dicynodon* and *Oudenodon*, including lacertiform animals, sometimes of large size, with crocodilian vertebrae, four or five of which form a sacrum; with a massive skull, lacertillan in most of its characters, but with chelonian jaws, which were doubtless increased in a horny beak; and as a rule with two great tusks, one on each side of the upper jaw, deeply socketed in the maxilla, and growing from persistent pulps.

The supposition that the Dinosaurian, Crocodilian, *Dicynodontian*, and Plesiosaurian types were suddenly created at the end of the Permian epoch may be dismissed, without further consideration, as a monstrous and unwarranted assumption.

didelph (di'del'f), *n.* A member of the *Didelphia*; a marsupial.

Didelphia (di-del'fi-ā), *n. pl.* [NL., *< Gr. δι-, two-, + δελφίς, womb.* Cf. *Didelphys.*] The *Marsupialia* or marsupial implanental mammals; one of the three subclasses of *Mammalia*, the other two being *Ornithodelphia* and *Monodelphia*. They have no placenta, and the womb double, whence the name—that is, the uterine dilations of the oviducts continue through life distinct from each other, right and left, and open into two distinct vaginæ, which debouch in turn into a urogenital sinus, forming, with the termination of the rectum, a common cloaca embraced by the external sphincter muscle, and in the male lodging the penis, which thus appears to protrude from the anus. The female has usually an abdominal pouch or marsupium, formed by a fold of the skin of the belly, in which the mammary glands open, and into which the blind, naked, and imperfectly developed young are received and carried for some time hanging to the nipples. The scrotum of the male occupies a similar position. Both the marsupium and the scrotum are supported to some extent by the marsupial bones characteristic of this group, being ossifications in the tendon of the external oblique muscle of the abdomen, articulated with the pubes. A cremasteric muscle in relation with these bones acts in the female upon the mammary glands, effecting their compression, and consequently the flow of milk into the mouths of the helpless young. There are true teeth of two or three kinds. The coracoid is reduced to a process of the scapula, as in ordinary mammals, not reaching the sternum, as in monotremes. The corpus callosum is rudimentary or wanting, and the brain relatively small. The *Didelphia* are among the oldest known mammals, and formerly had an extensive range, but are now mainly confined to the Australian region, the American opossums offering the principal exception. Some of the extinct forms were of great size; the kangaroos are the largest living representatives. The marsupials are notable for their great physiological adaptation to all the modes of life of ordinary mammals, their structure being modified in relation to the carnivorous, the herbivorous, the rodent, and other habitus, and their modes of progression and general economy being no less diverse. There is but one order, *Marsupialia* (which see).

Didelphyidae, **Didelphidae** (di-del-fi'i-dē, di-del-fi-dē), *n. pl.* [NL., < *Didelphis* + *-idae*.] A family of marsupial animals; the opossums. They have the feet pedimanous—that is, the hind feet as well as the fore with an opposable thumb, and thus fitted for grasping; all the toes clawed excepting the hallux; the tail generally long, scaly, and prehensile; and the pouch in some forms complete, in others rudimentary or wanting. The dental formula is: 5 incisors in each upper, 4 in each lower half-jaw; 1 canine, 3 premolars, and 4 molars in each half-jaw. The vertebral formula is: cervical 7, dorsal 13, lumbar 6, sacral 2, caudal 19 or more. The family is confined to America, where it alone represents the division of marsupial mammals. The leading genera are *Didelphis*, including most of the species, and *Chironectes*, the water-opossums. See *Didelphyidae*, *opossum*.

Didelphys (di-del'fis), *n.* [NL., < Gr. *di-*, two, + *δελφίς*, womb.] The typical and leading genus of marsupial placental mammals of the family *Didelphyidae*, containing the American opossums which are not web-footed. The genus formerly covered nearly or quite all the marsupials. The species are terrestrial and arboreal, but not aquatic, the water-opossums being separated under the name *Chironectes*. The pouch is usually well developed, as in the best-known species, *D. virginiana*, the common opossum of the United States, but is rudimentary in some of the South American forms. See *Didelphyidae*, *opossum*.

Didemnidæ (di-dem'ni-dē), *n. pl.* [NL., < *Didemnum* + *-idæ*.] A family of compound ascidians, typified by the genus *Didemnum*, having the body divided into thoracic and abdominal portions, and the viscera mostly situated behind the branchial cavity.

=**Syn.** 1. *Die, Expire, Decease, Perish.* To *die* is to cease to live, part with life, or become dead from any cause, and under any circumstances; it is the plainest and most direct of the words. *Expire* is often used as a softer word than *die*; it means to breathe out the life or emit the last breath. *Decease* is a euphemism, like *expire*, but is often an affection. *Perish* represents death as occurring under harsh circumstances of some sort, as violence or neglect; it emphasizes the idea of finality.

die³ (*dī*), *n.*; pl., in the 1st sense, *dices* (*dīs*); in the remaining senses, *dies* (*diz*). In def. 2 the word hardly admits of a plural. [The mod. sing. form *die* is due to the peculiar form of the pl., *dice*, ME. *dys*, etc. (see *dice*); the sing. would otherwise be **dee*, < ME. *dec*, a die, < OF. *de*, earlier *det*, pl. *dez*, F. *dé* = Pr. *dat* = Sp. Pg. It. *dado*, a die, cube, pedestal (whence E. *dado*, q. v.) (cf. G. *würfel*, a die, < *werfen*, throw). Thus *die*³ is a doublet of *date*¹, *datum*, and *dado*: see *date*¹.] 1. A small cube marked on its faces with spots numbering from one to six, used in gaming by being thrown from a box or the hand, the chance being decided by the highest number of spots turned up, and in several other ways. The numbers on opposite faces of a die always add up to 7, but otherwise there is no uniformity in the arrangement of the numbers. The number of dice used is either one, two, three, or five, according to the game.

There are half a dozen species, of which two, *D. Seguine* and *D. picta*, are well-known decorative plants in greenhouses, varying exceedingly in the color and form of the foliage. The roots, as in many other plants of the order, are very acrid and caustic, and the name *dumb-cane* has been given to *D. Seguine* in the West Indies, from its effect upon the speech when its root is bitten.

See *residual*.—**Dielectric capacity.** Same as *specific inductive capacity* (which see, under *capacity*).

II. *n.* A substance through or across which electric force is acting. The walls of a Leyden jar; the intervening medium, solid, liquid, or gaseous, between the plates of a condenser; and the insulating sheath around the conductor of a telegraph-cable, are examples of dielectrics. Electric induction across a dielectric causes a stress in it which, if great enough, will produce rupture. The maximum intensity of this stress which the material can bear is called its *dielectric strength*. When the dielectric strength of the air between two clouds, or between a cloud and the earth, is unable to withstand the electric forces, a flash of lightning takes place. The fracture of stones in buildings, of trees, etc., in a thunderstorm are illustrations of the effect of excessive dielectric stress.

Until this subject [induction] was investigated by Faraday, the intervening non-conducting body or *dielectric* was supposed to be purely negative, and the effect was attributed to the repulsion at a distance of the electrical fluid. Faraday showed that these effects differed greatly according to the *dielectric* that was interposed.

W. R. Grove, *Corr. of Forces*, p. 85.

Dielytra (*dī-ē'lī-trī*), *n.* [NL., < Gr. *δί-*, two-, + *ἐλύτρον*, sheath, shard: see *elytrum*.] Same as *Dicentra*.

The separate pronunciation of two vowels usually united as a diphthong; by extension of meaning, separate pronunciation of any two adjacent vowels, or the consequent division of one syllable into two. See *dialysis* and *distractio*, 8.—2. The sign (· ·) regularly placed over the second of two contiguous vowels to indicate that they are pronounced separately; the same sign used for other purposes. The dieresis is used most frequently over *e* preceded by *a* or *o*, in distinction from the diphthongs or digraphs *æ* and *œ*. In Greek manuscripts these dots were frequently written over *i* and *u* beginning a word or a syllable, thus serving also to show that they did not form the close of a diph-

thong (æ, ei, oi, vi, av, ev, ov), and their modern use is an extension of this. The employment of the dieresis to mark the full pronunciation of the letters *ed*, as termination of the preterit and past participle (for instance, *praiséd*), though sometimes seen, is not established usage, the acute or grave accent being more common. A similar sign consisting of dots is used merely as a diacritical mark, as in the notation of pronunciation in this book (for instance, *ä, ö, ü*). A similar mark is used in German to indicate the umlaut. See *umlaut*.

3. In *pros.*, the division made in a line or a verse by coincidence of the end of a foot and the end of a word; especially, such a division at the close of a colon or rhythmic series. Macaulay, Athenian Orators.

Virtual difference, a difference in respect to what would happen under certain contingencies. Thus, one egg and another, though they appear to have no actual differences, may have virtual differences, in that one will hatch a male and the other a female. = *Syn. 1* and *2*. **Difference, Distinction, Diversity, Dissimilarity, Disparity, Disagreement, Variance, Discrimination**, contrariety, dissimilitude, variety. The first five words express the fact of unlikeness; *difference* and *distinction* apply also to that wherein the unlikeness lies, and *discrimination* to the act of making or marking a difference, and to the faculty of discerning differences. (See *discernment*.) *Distinction* applies also to the eminence conferred on account of difference. *Difference* is the most general, applying to things small or great, internal or external. *Distinction* is generally, but not always, external, and generally marks delicate differences: as, the *distinction* between two words that are almost synonymous. *Diversity*, by its derivation, is a great or radical difference, equal to going in opposite directions. *Dissimilarity* is unlikeness, generally in large degree or essential points. *Disparity* is inequality, generally in rank or age. *Disagreement* and *variance* are weak words by their original meaning, but through euphemistic use have come to stand for dissimilarity of opinion of almost any degree, and for the resulting alienation of feeling, or even dissension and strife.

H. Spencer, Prin. of Psychol., § 1.

From these different relations of different things, there necessarily arises an agreement or disagreement of some things to others. *Clarke, Attributes, xiv.*

But the relation of opposition is often lost in that of mere comparison, leading to the use of *to* instead of *from*. This use is regarded as colloquial or incorrect, and is generally avoided by careful writers.

See *interference*.

Diffraction Bands.

Thus, if a beam of monochromatic light is passed through a narrow slit and received on a screen in a dark room, a series of alternately light and dark bands or fringes is seen, which diminish in intensity and distinctness on either side of the central line; if white light is employed, a series of colored spectra of different orders is obtained. Similar phenomena of diffraction are obtained from diffraction gratings, which consist of a band of equidistant parallel lines (from 10,000 to 30,000 or more to the inch), ruled on a surface of glass or of polished metal; the spectra obtained by this means are called *interference* or *diffraction spectra*. They differ from prismatic spectra, since in them the colors are uniformly distributed in their true order and extent according to their difference in wave-length; while in the latter the less refrangible (red) rays are crowded together, and the more refrangible (blue, violet) are dispersed. Diffraction gratings are now much used, especially in studying the solar spectrum. The best gratings are ruled on speculum metal with a concave surface (often called *Rouland gratings*, after Professor Henry A. Rowland of Baltimore), and give an image of the spectrum directly, without the intervention of a lens.

See *cerebellum*.—**Digastric muscle**. See *muscle*.—**Digastric nerve**, a branch of the facial nerve, supplying the posterior belly of the digastric muscle.

II. n. A muscle of the lower jaw: so called because in man it has two bellies. In its generalized condition it is a principal depressor of the lower jaw, opening the mouth and antagonizing the temporal and masseteric muscles. It arises from the back part of the skull, and is inserted into the mandible. In man and many other animals (though not in most) it becomes digastric or double-bellied, the intervening tendon being bound by an aponeurotic loop to the hyoid bone, and the muscle thus becoming an elevator of the hyoid as well as a depressor of the jaw. It arises from the digastric groove of the mastoid, and is inserted into the symphysis menti. With the lower border of the jaw its two bellies, which meet at an angle, bound the surgical triangle of the neck known as the submaxillary space.

(d) A strong close vessel, in which bones or other substances may be subjected, in water or other liquid, to a temperature above that of boiling. It is made of iron or other metal, with an airtight lid, in which is a safety-valve. In this vessel animal or other substances are placed, and submitted to a higher degree of heat than could be obtained in open vessels, by which means the solvent power of the liquid is greatly increased. It is called in this form (first described in 1631) *Papin's digester*, from its inventor, Denis Papin, a Frenchman. The principle is applied in other forms, and by it various useful products are obtained on a large scale from animal carcasses unfit for other use. In other kinds of digesters the operation is chemical, and does not imply the extreme pressures employed in that above described. Thus, in one kind, nut-galls or other vegetable products are placed in a vessel and saturated with ether; the volatile extract falls in minute drops into a closed vessel below, which is connected by means of a pipe with the top of the upper vessel to prevent the escape of the ether. See *rendering-tank*. Also *digestor*.

2. The physiological process of converting the food from the state in which it enters the mouth to that in which it can pass from the alimentary canal into the blood-vessels and lymphatics. The principal features of the process, apart from the comminution of the food, are the conversion of starch into sugar and of peptids into peptones, and the emulsification of the fats. These changes are effected by the action of soluble ferments furnished by the salivary glands, the gastric glands, the pancreas, and the intestinal glands. The bile is also of service, especially in the emulsification of the fats.

Hence—3. The function or power of assimilating nutriment.

Among all these Indians the most miserable are the root-diggers, who live almost entirely on the scanty roots of plants which are found in the ravines or plains. These poor wretches suffer all the hardships of hunger and want. They are compelled to spend two thirds of the year among the mountains, with no other resource than a little fish and roots. When both these provisions fail, it is impossible to picture the wretched state of these pariahs of the wilderness.
